PRINCIPAL FESTIVALS AND ANNIVERSARIES, 2020 A.D.

English New Year's Day	Jan.	1	Wed.
Guru Govinda Singh's Birthday	Jan.	2	Thurs.
Birthdat of Swami Vivekananda	Jan.	12	Sun.
Lohri (Punjab, J. & K.)	Jan.	13	Mon.
Bhogi (S. India)	Jan.	14	Tues.
Magha Bihu	Jan.	15	Wed.
Makara Sankranti Snana (W. Bengal)	Jan.	15	Wed.
Pongal (S. India)	Jan.	15	Wed.
Tai Pongal (Kerala)	Jan.	15	Wed.
Tamil Nadu New Year's Day	Jan.	15	Wed.
Mattu Pongal or Kanuvu (S.India)	Jan.	16	Thurs.
Birth Tithi of Swami Vivekananda	Jan.	17	Fri.
Netaji's Birthday	Jan.	23	Thurs.
Ratanti Kalika Puja	Jan.	23	Thurs.
Mauni Amavasya	Jan.	24	Fri.
Magha Sukladi	Jan.	25	Sat
Republic Day	Jan.	26	Sun.
Birthday of Lala Lajpath Rai	Jan.	28	Tues.
Martyr's Day (Mahatma Gandhi Commemoration day)	Jan.	30	Thurs.
Vasanta Panchami	Jan.	30	Thurs.
Saraswati Puja	Jan.	30	Thurs.
Desert Festival -3 days (Jaisalmer)	Feb.	7	Fri.
Floating Festival (Tai Poosam)	Feb.	8	Sat.
Guru Rabi Das's Birthday	Fev.	9	Sun.
Birth Day of Swami Dayananda Saraswati	Feb.	18	Tues.
Sivaji Jayanti	Feb.	19	Wed.
Maha Sivaratri	Feb.	21	Fri.
Birth Tithi of Shri Ramakrishna Dev	Feb.	25	Tues.
Holikadahana	Mar.	9	Mon.
Birthday Tithi of Shri Chaitanya	Mar.	9	Mon.
Dolyatra (W. Bengal)	Mar.	9	Mon.
Holi, Hola, Vasantotsava	Mar.	10	Tues.
Varsitapa Parva begins (Jain)	Mar.	16	Mon.
INDIAN NEW YEAR'S DAY (1942 SAKA ERA)	Mar.	21	Sat.
Cheti Chand (Sindhi New Year's Day)	Mar.	25	Wed.
Chaitra Sukladi, Gudi Padva, Ugadi	Mar.	25	Wed.
Telugu New Year's Day	Mar.	25	Wed.
Gangaur (Gauri Tritiya)	Mar.	27	Fri.
Sarhul (Bihar)	Mar.	27	Fri.
Oli Begins (Jain)	Mar.	31	Tues.
Basanti Durga Puja (Saptami)	Mar.	31	Tues.
Annapurna Puja	Apr.	1	Wed.
Ramanavami	Apr.	2	Thurs.
Mahavira Jayanti (Jain)	Apr.	6	Mon.
Oli ends (Jain)	Apr.	8	Wed.
Hanumat Jayanti (S. India)	Apr.	8	Wed.
Vishu (Kerala)	Apr.	13	Mon.
Vaisakhi (Delhi, Punjab, Haryana, H.P. & Orissa)	Apr.	13	Mon.
Cheiraoba (Manipur)	Apr.	13	Mon.
Meshadi	Apr.	14	Tues.
Dr. B. R. Ambedkar Jayanti	Apr.	14	Tues.
Vaisakhadi (Bengal and Assam New Year's Day)	Apr.	14	Tues.
Bohag Bihu (Assam)	Apr.	14	Tues.
Shri Vallabacharya Jayanti	Apr.	18	Sat.
Babu Kuer Singh Day (Bihar)	Apr.	23	Thurs.
Tithi of Sri Deva Damodar (Assam)	Apr.	23	Thurs.
Varsitapa Parva ends (Jain)	Apr.	26	Sun.
Akshaya Tritiya	Apr.	26	Sun.
Shri Sankaracharya Jayanti	Apr.	28	Tues.
Sri Ramanujacharya Jayanti	Apr.	29	Wed.
May Day	May	1	Fri.
Sita Navami (Janaki Navami)	May	2	Sat.
Trichur Pooram (Kerala)	May	2	Sat.
Minakshi Kalyanam	May	4	Mon.
Buddha Purnima	May	7	Thurs.
Birthday of Rabindranath Tagore	May	8	Fri.
Maharaja Pratap Jayanti (Rajasthan)	May	25	Mon.
Guru Arjan Dev's Martyrdom Day (Sikh)	May	26	Tues.
Jamatri Sasthi, Jamai Sasthi (W. Bengal)	May	28	Thurs.
Ganga Dasahara	Jun.	1	Mon.
Deva Snana Purnima	Jun.	5	Fri.
Guru Hargovind's Birthday	Jun.	6	Sat.
Rajas Samkranti (Orissa)	Jun.	14	Sun.
Rathayatra	Jun.	23	Tues.
Kharchi Puja (Tripura)	Jun.	28	Sun.
Punaryatra (W. Bengal)	Jun.	30	Tues.
Ultorath (Orissa)	Jul.	1	Wed.
Guru Purnima, Vyasa Puja	Jul.	5	Sun.
Naga Panchami (W. Bengal)	Jul.	10	Fri.
Birthday of Poet Bhanu Bhakt	Jul.	13	Mon.
Ker Puja (Tripura)	Jul.	14	Tues.
Manasa Puja Begins (W. Bengal)	Jul	16	Thurs.
Teej (Madhusrava Tritiya)	Jul.	23	Thurs.
Naga Panchami (except W. Bengal & Orissa)	Jul.	25	Sat.
Goswamy Tulsidas Jayanti	Jul.	27	Mon.
Jhulana Yatraramabha	Jul.	30	Thurs.
Tilak Commemoration Day	Aug.	1	Sat.
Jhulana Yatra Samapana	Aug.	3	Mon.
Avani Avittam (S. India)	Aug.	3	Mon.
Raksha Bandhan	Aug.	3	Mon.
Vaikhanasa Jayanti (S.India)	Aug.	3	Mon.
Jhulana Purnima	Aug.	3	Mon.
Solono (Delhi)	Aug.	3	Mon.
Janmastami (Vaishnava)	Aug.	12	Wed.
Nandotsava, Gokulastami	Aug.	12	Wed.
Independence Day	Aug.	15	Sat.
Paryusana Parvarambha (Jain)	Aug.	16	Sun.
Manasa Puja ends (W. Bengal)	Aug.	16	Sun.
Simhadi (Kerala New Year's Day)	Aug.	17	Mon.
Jain Festival	Aug.	19	Wed.
Tithi of Shri Sankara Deva (Assam)	Aug.	20	Thurs.
Ganesh Chaturthi, Vinayaka Chaturthi	Aug.	22	Sat.
Samvatsari (Jain-Chaturthi Paksha)	Aug.	22	Sat.
Samvatsari (Jain-Panchami Paksha)	Aug.	23	Sun.
Radhastami	Aug.	26	Wed.
Birthday Tithi of Shri Anukul Thakur	Aug.	27	Thurs.
First Onam Day	Aug.	30	Sun.
Onam (Thiru Onam Day)	Aug.	31	Mon.
Ananta Chaturdasi	Sep.	1	Tues.
Sri Narayana Guru Dev's Birthday (Kerala)	Sep.	2	Wed.
Tithi of Shri Madhava Deva (Assam)	Sep.	7	Mon.
Sri Krishna Jayanti (Assam, Tamilnadu, Kerala)	Sep.	10	Thurs.
Shri Jayanti (Ramanuja)	Sep.	10	Thurs.
Jitia (Bihar)	Sep.	10	Thurs.
Visvakarma Puja	Sep.	16	Wed.
Mahalaya Amavasya	Sep.	17	Thurs.
Samadhi Day of Sri Narayana Guru (Kerala)	Sep.	21	Mon.
Karma (Bihar)	Sep.	27	Sun.
Mahatma Gandhi's Birthday	Oct.	2	Fri.
Maharaja Agrasen's Jayanti	Oct.	17	Sat.
Kati Bihu (Assam)	Oct.	17	Sat.
Oli begins (Jain)	Oct.	23	Fri.
Durga Puja (Saptami)	Oct.	23	Fri.
Durga Puja (Mahastami)	Oct.	24	Sat.
Durga Puja (Mahanavami),	Oct.	25	Sun.
Durga Puja (Vijaya Dasami) ,Dussehra	Oct.	26	Mon.
Kojagari Lakshmi Puja (W. Bengal)	Oct.	30	Fri.
Maharshi Valmiki's Birthday	Oct.	31	Sat.
Oli ends (Jain)	Oct.	31	Sat.
Dhana Trayodasi	Nov.	13	Fri.
Naraka Chaturdasi Dipavali (S. India)	Nov.	14	Sat.
Hanumat Jayanti (N. India)	Nov.	14	Sat.
Kali Puja (Lakshmi Puja)	Nov.	14	Sat.
Maha Lakshmi Puja	Nov.	14	Sat.
Dipavali (Diwali)	Nov.	14	Sat.
Mahavira Nirvana (Jain)	Nov.	14	Sat.
Children's Day	Nov.	14	Sat.
Kartika Sukladi	Nov.	16	Mon.
Kartika Puja	Nov.	16	Mon.
Bhai Duj, Dwat Puja (Bihar)	Nov.	16	Mon.
Bhratri Dvitiya, (W. Bengal)	Nov.	16	Mon.
Death Anniversary of Lala Lajpath Rai	Nov.	17	Tues.
Chhat Puja (Bihar)	Nov.	20	Fri.
Jagaddhatri Puja	Nov.	23	Mon.
Guru Teg Bahadur's Martyrdom Day	Nov.	24	Tues.
Tulasi Vivaha	Nov.	26	Thurs.
Vaikuntha Chaturdasi (Pradosh)	Nov.	28	Sat.
Rasayatra (Smarta)	Nov.	29	Sun.
Rasayatra (Vaishnava)	Nov.	30	Mon.
Rathayatra (Jain)	Nov.	30	Mon.
Kartiki Purnima, Puskar Fair, Rasa Purnima	Nov.	30	Mon.
Guru Nanak's Birthday	Nov.	30	Mon.
Asom Divas	Dec.	2	Wed.
Vivah Panchami (Bihar)	Dec.	19	Sat.
Gita Jayanti	Dec.	25	Fri.
Mauni Ekadasi(Jain)	Dec.	25	Fri.

PREFACE

This annual astronomical ephemeris has stepped into 82nd year of its publication with the present issue for 2020. The Ephemeris was founded by late N. C. Lahiri in 1939, the first Indian member of the Ephemerides-Commission of the International Astronomical Union, Paris, and the first Officer-in-charge of the then Nautical Almanac Unit of the Govt. of India (now known as Positional Astronomy Centre) at Kolkata. The local almanacs published from different parts of India are still giving erroneous astronomical parameters for preparation of the almanacs. We are earnestly exerting our efforts for rectification of such parameters shown in those almanacs. This ephemeris is intended to provide most accurate and up-to-date astronomical data in advance to its users.

The ephemeris is based on *nirayana* or sidereal system of calculation. The basis of the nirayana zodiac is the adoption of 285 A. D. or 207 Saka as the *zero ayanamsa* year. This value was adopted by Shri N. C. Lahiri in this Ephemeris from 1948 issue. The Calendar Reform Committee appointed by the Govt. of India in 1952 recommended adoption of this value of *ayanamsa* and later the Govt. of India also adopted this system of *ayanamsa* in 1953. In view of this, it is called as *Lahiri-Ayanamsa.* This value of *ayanamsa* is now being used in almost all the reformed panchangs and ephemeris in India as well as in the *Indian Astronomical Ephemeris* and the *Rashtriya Panchangs* of the Govt. of India. It is worth mentioning that the date of coincidence of the *Sayana* and *Nirayana* zodiacs on the Vernal Equinox day of 285 A.D. based on the position of the star *Chitra* (α Virginis) in Spica as was determined by late N. C. Lahiri during his life time is almost the same as derived from the data available from the *Astronomisches Rechen Institute of Heidelberg, Germany.*

We express our thanks to the Director, Positional Astronomy Centre, Kolkata of India Meteorological Department (Govt. of India) for kindly supplying some astronomical data for use in the Ephemeris. Sincerest thanks are also to our esteemed readers and users of this ephemeris for their kind co-operation and suggestions. Suggestions for further improvement of this ephemeris would be highly appreciated. Utmost care is always taken to bring out this publication free of any error.

We are making best efforts to add each year some additional data which are to facilitate the users of this ephemeris for their computational work.

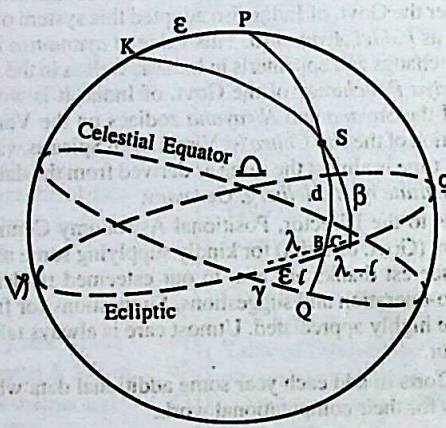
EXPLANATORY NOTES

The most important reference planes in astronomy are the celestial equator and the ecliptic. The positions of all heavenly bodies are usually given in terms of these planes taking the first point of Aries as the initial point. The celestial equator is the great circle of the celestial sphere in which the plane of the earth's equator cuts the celestial sphere. The apparent path of the Sun in the sky is known as the *ecliptic* and is the most important reference circle in the heavens. It is a great circle cutting the celestial equator at an angle of about $23\frac{1}{2}°$. The angle is 23° 26' 10.33" on Jan. 1, 2020 and known as *obliquity of the ecliptic.* The two points of intersection of the ecliptic with the celestial equator are called the First point of Aries (Vernal Equinox *i.e.* V.E.) and the First point of Libra (Autumnal Equinox) respectively. The First point of Aries is the ascending node of the Sun in relation to the ecliptic on the equator, when it passes from the south to the north. The position of the heavenly bodies in the sky is indicated by measuring their co-ordinates along the great circle of either the celestial equator or of the ecliptic and at right angles to them.

The position of a body on the celestial globe showing the spherical co-ordinates of a star is shown below.



Here,	P	=	Celestial Pole *(Dhruva)*
	γ Q ♎	=	Celestial equator
	K	=	Pole of the ecliptic *(Kadamba)*
	γ ♋	=	Plane of the ecliptic
	γ	=	First point of Aries (Vernal Equinox)
	♋	=	First point of Cancer (Summer Solstice)
	♎	=	First point of Libra (Autumnal Equinox)
	♑	=	First point of Capricorn (Winter Solstice)
	S	=	A heavenly body
	PS	=	Great circle through P, S. cutting equator at Q.
	γ Q	=	Right Ascension $= \alpha$
	QS	=	Declination $= \delta$
	KS	=	Great circle through K, S. cutting ecliptic at C.
	γ C	=	Celestial longitude $= \lambda$
	CS	=	Celestial latitude $= \beta$
	γ B	=	Polar longitude or *Dhruvaka* $= l$
	BS	=	Polar latitude or *Vikshepa* $= d$

The last two peculiar co-ordinates, now no longer used.

The position of a stellar body may be defined by either its right ascension (α) and declination (δ) or its celestial longitude (λ) and latitude (β).

In order to obtain the *nirayana* (sidereal) longitudes of any celestial objects, the amount of *ayanamsa* is to be deducted from the corresponding values of the tropical *(Sayana)* longitudes.

EXPLANATORY NOTES

The initial point or reference point of the zodiac is fundamental for obtaining positions of the heavenly bodies. For measuring celestial longitude in the tropical system, the vernal equinoctial point, which is one of the intersection points of the ecliptic and the equator has been taken as the initial point. This initial point in the tropical system (*i.e.* V. E. point) does not occupy any fixed position among the stars, it always moves backward in the western direction in the starry heavens due to precession of the equinoxes with an annual motion of about 50.3" completing the circle in about 26000 years. The longitudes measured in this system is called the Tropical or *Sayana* longitude. In the Sidereal or *Nirayana* system the reference circle is the *ecliptic*.

In the *Sidereal or Indian system*, in order to stabilise the zodiac, a point has been taken as the origin which is permanently fixed on the ecliptic, so that co-ordinates of the fixed stars in the sky do not change. So in the Sidereal system, the reference point is a fixed point on the ecliptic in relation to some prominent stars, whose position is fixed in the sky. The *nirayana* longitudes of stars being nearly invariable, the Indian signs always contain the same star groups in the divisions.

The longitudes of celestial objects are measured from the fixed point on the ecliptic among the stars. The distance of this fixed initial point from the V. E. point (*i.e.* its celestial longitude) is called *Ayanamsa*. The longitude measured from this initial point is called *Nirayana* or Sidereal longitude.

In the nirayana system the problem of fixation of the initial point of the nirayana zodiac is found to be very much controversial— different organisations are following different values of *Ayanamsa* as obtained from their own observations. This problem was critically studied by late N. C. Lahiri during his life time. After many years of research and calculation, he concluded that the zodiacs of the two systems *i.e.* the tropical and the sidereal coincided in 285 A. D. The initial point of the sidereal zodiac was the same as the equinoctial point (*viz.*, First point of Aries) of the Vernal equinox day of 285 A.D. The star Spica (*Chitra* — α Virginis) was very close to the ecliptic and located at 180° (opposite to V. E. point) away from the vernal equinoctial point on March 22 of 285 A.D. when both the *sayana* and *nirayana* longitudes of the star *Chitra* (Spica) were the same as 180° 00' 03".

It is worth mentioning that the time of coincidence of the *Sayana* and *Nirayana* zodiacs was determined many years ago and obtained the above value by late N. C. Lahiri, former member of the Ephemerides-Commission of the International Astronomical Union (Paris). Recently the value was also computed from the past star positions at the V. E. point of 285 A. D. from the data as available from the *Astronomisches Rechen Institut of Heidelberg*, Germany, the well known International Astronomical Institute, being the authority as regards the position of stars and is found to be almost the same. The tropical longitude of the star *Spica* as computed from the data obtained from this Institute is also very near to 180° on the Vernal Equinox day of 285 A.D. The difference between the two sets of calculations, one by late N. C. Lahiri and the other is so small that no appreciable change in the value of *Ayanamsa* is at all needed.

According to the above initial point of the *nirayana* zodiac, the value of *Ayanamsa* comes out as 24° 07' 55" on Jan. 1, 2020. The nirayana longitude of the star Spica has been shown as 179° 59' 02" on Jan. 1, 2020. Due to proper motion, the nirayana longitude of the star Spica *(Chitra)* has, however, diminished by 1'1" during the period 1735 years from 285 A.D.

For the calculation of *Rasis* and *Nakshatras*, a fixed initial point on the ecliptic has been taken as the origin from which the longitudes are measured. The tropical longitude of this initial point on March 21, 1956 has been adopted as 23° 15' 00".

The Indian Astronomical Ephemeris of the Government of India adopted, on the basis of the recommendations of the Calendar Reform Committee, a value of *Ayanamsa* which was less by only 5".8 than the above. From the 1985 issue a minor correction of 0.658" has been made which has also been followed in this ephemeris according to the *Indian Astronomical Ephemeris*.

Kirtikant Sharma Collection, Najafgarh

Details of the Ephemeris

In this ephemeris apparent geocentric sidereal *(Nirayana)* longitudes of the Sun, Moon and planets have been given daily for 0*h* Universal Time (U.T.) *i.e.* 0*h* G. M. T. (Greenwich mean Time at midnight) or 5*h* 30*m* a.m. Indian Standard Time (I.S.T.). The longitudes are *apparent geocentric positions* as seen from the centre of the Earth.

The topocentric positions i.e. the positions as seen by an observer at any specified point on the Earth's surface, slightly differ from the geocentric position, being 9 arc seconds for Sun, 62 arc minutes for Moon and 1 arc minute for planets. If topocentric positions are required, these have to be calculated separately.

The longitudes given daily may be interpolated for any required moment by using the daily motions of the planets. As a result of irregular rotation of the Earth, the Greenwich time determined from the Earth's rotation has been found inconvenient for calculation of planets' positions, for which *Ephemeris Time* or E.T. is now used. The mean elements of planets have accordingly been given in this book for 0*h* E.T. and for convenience of users the daily positions of planets have been given for 0*h* G.M.T. or U.T. or 5*h* 30*m* a.m. I.S.T.

The *Nirayana Longitude* as given in the Ephemeris is also obtainable by subtraction of *Ayanamsa* from the tropical or Sayana longitude given in western ephemerides. The first figure in the given nirayana longitude denotes the sign (indicated by the symbol[s], meaning sign or *Rasi)* of the *Nirayana* or fixed zodiac, *e.g.*, 0 means that the planet is in *Mesa* (Aries), 1 means *Vrisa* (Taurus), 2 *Mithuna* (Gemini), etc.

Sidereal Time is for 12*h* noon local mean time (L.M.T.) of $82\frac{1}{2}°$ East longitude, but is applicable for the whole of India without much modification for local mean noon. L.M.T. is to be used in determining the Sidereal time of any moment, but in finding the longitudes of planets etc. the Standard Time should be made use of.

Apparent Noon is the local mean time of Sun's meridian passage *viz.* the mid-day. The equation of time in the sense of correction applied to the local mean time to obtain the local apparent time, may be deduced as follows : Equation of time = 12*h* – Apparent noon.

Meridian passages (M.Pass) of the Moon (shown daily) and planets (at alternate days) given are in local mean time calculated for the Central Meridian of India. *viz.* for $82\frac{1}{2}°$ East longitude. With slight correction these may be used in *local mean time* for all other places. M. Pass. of a planet (other than the Moon) requires almost no correction for places in India. For the Moon, the given time of meridian passage should be diminished by 1 minute for Kolkata and eastern India and increased by 1 minute for Delhi, Mumbai and western India. For further west, it should be increased according to the daily variation of the M. Pass. time in proportion to the longitude west of India's central meridian. Apparently the planets rises in the eastern horizon nearly *6 hours* before M. Pass and sets nearly 6 *hours* after M. Pass.

The ending times of *Tithi, Nakshatra, Yoga* and *Karana* have been given daily in the Ephemeris as are current at 5-30 a.m. I.S.T. on the day.

The following prefixes and suffixes have been added to the longitude of planets in the daily Ephemeris :—

n, *n* = the planet changes the *nakshatra* by direct (n) or retrograde (*n*) motion, the number of the nakshatra division. *i.e.* the lunar mansion in which the planet is situated on the first day of the month has been shown at the top of the column of longitudes. In case of *Rahu*, the first figure represents the nakshatra of *Rahu* and the second figure that of *Ketu*.

R, *R* = the planet becomes retrograde (R), or has already become so (*R*).

D = the planet becomes direct.

s = the planet sets (s) heliacally.

s = the planet has already set (*s*)

r = the planet rises heliacally.

(☌, ☍) = the planet is in conjunction ☌ with the Sun or in opposition ☍ to the Sun.

e = the greatest elongation from the Sun on that day of the Inferior planets *i.e.* Mercury & Venus.

Details of the Ephemeris

The timings of ***Sunrise and Sunset*** as given in this Ephemeris are in I.S.T. The timings relate to the visibility of the *Sun's upper limb*, on the horizon, where time corrections for refraction and Sun's semi-diameter have been included. The sunrise and sunset times of the *Central Station of India* given in I.S.T. is the same as the L.M.T. of the Meridian of $82\frac{1}{2}°$E. Long. relate to the appearance and disappearance of the upper limb of the Sun on the horizon. The Local Mean Time of Sunrise and Sunset for a particular latitude may be used as L.M.T. for all places on the same *latitude*. As a result of refraction, the *centre of* the Sun becomes visible on the horizon about 2*m* 20*s* before the calculated time of Sunrise and remains so after the time of Sunset. For visibility of the Sun's *upper limb*, the above correction is about 3*m* 30*s*, the amount of horizontal refraction is taken as 31' and the semi-diameter as 16', so that the centre of the Sun is actually 47' below the horizon at such times of rising and setting.

Mean Rahu and True Rahu— As in the case of the Sun and the Moon, the Lunar Node (*i.e. Rahu*) has also got the *mean* position as well as the *true* position, the greatest difference between the two being about $1\frac{3}{4}°$ degrees. In view of the fact, that we are concerned only with the true or apparent position in case of planets, the position of *True Rahu* has been given in the daily ephemeris more accurately taking further terms of corrections from 1986 issue and for facility of the users the mean position has also been given daily. Motion of True *Rahu* is not uniform, sometime it becomes direct even. The motion of mean *Rahu* is, however, always retrograde and uniform.

National Calendar— In accordance with the recommendations of the Calendar Reform Committee, appointed by the Govt. of India in 1952, a reformed **Indian National Calendar** was introduced with effect from March 22, 1957 which was the starting date of the National Calendar—*Saka 1879, Chaitra 1*. The year of National Calendar begins with *Chaitra 1* on March 22 in a Gregorian common year and on March 21 in a leap year. The months of the Calendar have got fixed number of days.

The beginning dates of months are as follows :— Chaitra : Mar. 22 (Mar. 21 in a leap-year); Vaisakha-Apr. 21; Jyaistha-May 22; Asadha-June 22; Sravana-July 23; Bhadra -Aug. 23; Asvina-Sept. 23; Kartika-Oct. 23; Agrahayana-Nov. 22; Pausa-Dec. 22; Magha-Jan. 21 and Phalguna-Feb. 20.

Time reckoning in India

Originally cities of India used to maintain local time of her own. Before 1.1.1880 some provinces used time same as Calcutta local time. Afterwards the old Railway time, the same as the local time of Madras (now Chennai 5*h* 20*m* 50*s* ahead of G.M.T.) began to come into use. Thereafter, most cities gradually adopted this time.

Till 1905, the local Mean Time (L.M.T.) of the Madras observatory (5*h* 20*m* 50*s* ahead of G.M.T.) was used all over India by the Postal and Railway authorities. From January 1, 1906 the half hour time zone was adopted for the purpose and I.S.T. was introduced which related to the L.M.T. of 82° 30'E. Meridian, *i.e.* 5*h* 30*m* ahead of G.M.T. Since then this time is being used as I.S.T. except for the short period as stated below :—

From 1st September, 1942 to 14th October, 1945, the Indian Standard Time was advanced by one hour all over India including modern Bangladesh and Pakistan for purposes of day-light saving during the period and was thus 6*h* 30*m* ahead of G.M.T. Any recorded time of this period should therefore be reduced by *1 hour* to get I.S.T.

Kolkata and many places in Bengal and some places of the adjacent provinces like Bihar, Jharkhand, Assam and Orissa used to maintain local time instead of the standard time up to end of September 1941. The local standard time is known in some countries simply as local time.

Bengal Time was introduced from 1.10.41 during war time by Bengal Govt. which was more than one hour from I.S.T. Actually it was the Standard time of Burma (Myanmar). *Calcutta time* is less by 36*m* 30*s* from *Bengal time*. After that date there were changes of varying nature in the time reckoning of different places as stated overleaf.

Time Changes in India

In some parts of Bengal and adjoining areas	Before 1.10.41	L.M.T.	Reduction to I.S.T. – 0h 23m
Calcutta and adjoining areas	Before 1.10.41	Calcutta Local Time	– 0h 23m
Whole of Bengal	From 1.10.41 to 14.5.42	Bengal Time	– 1h 0m
Whole of Bengal	From 15.5.42 to 31.8.42	I.S.T.	0h 0m
Whole of Bengal	From 1.9.42 to 31.8.47	Bengal Time	– 1h 0m
West Bengal	Since 1.9.1947	I.S.T.	0h 0m
Assam (Before 1.11.1941-L.M.T.)	From 1.11.41 to 14.5.42 & 1.9.42 to 14.10.45	Same as Bengal Time	– 1h 0m
	From 15.5.42 to 31.8.42 & From 15.10.1945	Same as I.S.T.	0h 0m
Bihar (Before 1.12.1941-L.M.T.) Jharkhand	From 1.12.41 to 14.5.42 & 1.9.42 to 14.10.45	Same as Bengal Time	– 1h 0m
	From 15.5.42 to 31.8.42	Same as I.S.T.	0h 0m
Goa (Before 18.7.1911 - L.M.T.)	From 18.7.1911 to 31.8.42	Same as I.S.T.	0h 0m
	From 1.9.42. to 14.10.45	Same as Bengal Time	– 1h 0m
	From 15.10.45	Same as I.S.T.	0h 0m
Rest of India (Before 1.1.1880 - L.M.T.)	From 1.1.1880 to 31.12.1906	L.M.T. of Chennai 5h 21m ahead of G.M.T.	0h +9m
	From 1.1.1907 to 31.8.1942	Same as I.S.T.	0h 0m
	From 1.9.42 to 14.10.45	Same as Bengal Time	– 1h 0m
	From 15.10.45	Same as I.S.T.	0h 0m
Bengal Time relates to L.M.T. of 97° 30' E. Meridian			

East Pakistan observed Bengal time for civil purposes and Pakistan standard time, same as I.S.T. for Railways and Postal work etc. upto 30.9.1951. From 1.10.51 Bangladesh (former East Pakistan) Standard Time is 30*m* more than I.S.T. and Pakistan (former West Pakistan) standard time is 30*m* less than I.S.T.

Sayana Vyatipata and Vaidhriti Yoga, 2020

The ancient Indian astronomers used two kinds of aspect of the Sun and the Moon *viz.*, *Vyatipata* aspects, when the sum of the *tropical longitude* of the Sun and the Moon amounts to 180° and the *Vaidhriti* aspect when it amounts to 360°. These aspects treated as special *Yoga* are shown below.

Beginning Dates of Islamic Calendar, 2020

The *beginning* dates of the different months of the Islamic Calendar for the year 2020 determined on the basis of the first visibility of the lunar crescent after the New Moon day calculated for the Central Station of India ($82\frac{1}{2}$° E. Long.) are as follows.

The months of the Islamic Calendar actually begin from the sunset times of preceding day but in practice the months are taken to begin from *the next day.*

1441 Hejira (2020 A.D.)		1441 Hejira (2020 A.D.)		1442 Hejira (2020 A.D.)	
Jamadu's Sani	(30) Jan. 27	Z'ulquada	(30) Jun. 23	Safar	(30) Sep. 19
Rajab	(29) Feb. 26	Zulhijja	(29) Jul. 23	Rabiul Awwal	(29) Oct. 19
Shaban	(30) Mar. 26	1442 Hejira (2020 A.D.)		Rabius' Sani	(30) Nov. 17
Ramadan	(30) Apr. 25	MUHARRAM	(29) Aug. 21	Jamadu'l Awwal	(29) Dec. 17
Shawwal	(29) May 25			1442 Hejira (2021 A.D.)	
				Jamadu's Sani	(30) Jan. 15

The date may vary by one day depending on the visibility of lunar crescent.

Beginning Dates of Vedic Solar Months & Indian Seasons, 2020

Month	Season	Date	Month	Season	Date
Tapasya (Kumbha)	WINTER (*Sisira*-2nd Month)	Jan. 21	Navasya (Simha)	RAINS (*Varsa*-2nd Month)	Jul. 23
Madhu (Mina)	SPRING (*Vasanta*-1st Month)	Feb. 20	Isa (Kanya)	AUTUMN (*Sarat*-1st Month)	Aug.23
Madhava (Mesha)	SPRING (*Vasanta*-2nd Month)	Mar.22	Urja (Tula)	AUTUMN (*Sarat*-2nd Month)	Sep. 23
Sukra (Vrisa)	SUMMER (*Grishma*-1st Month)	Apr. 21	Sahas (Vrischika)	EARLY WINTER (*Hemanta*-1st Month)	Oct. 23
Suci (Mithuna)	SUMMER (*Grishma*-2nd Month)	May 22	Sahasya (Dhanus)	EARLY WINTER (*Hemanta*-2nd Month)	Nov.22
Navas (Karkata)	RAINS (*Varsa*-1st Month)	Jun. 21	Tapas (Makara)	WINTER (*Sisira*-1st Month)	Dec.22

Dakshinayana from Jun. 21 & *Uttarayana* from Dec. 22.

Dhanus	Dec.	15	21	32	Pausa	Dec. 22	Dec. 16	Dec. 15	Dec. 16	Dec. 16
Makara(2021)	Jan.	14	08	15	Magha	Jan. 21	Jan. 15	Jan. 14	Jan. 14	Jan. 14

* In Assam the month names are almost the same like Vaisakha, Jyaistha etc. but have different spelling and pronounciation *e.g.* Bohag, Jeth, etc. Solar Asadha begins on Jun. 16 in Assam for this year.

** In Orissa although the beginning of months are shown according to sunrise rule but actually the months start from the next day according to local custom. Month names are also mentioned in Orissa as Mesha, Vrisha etc. as well as Vaisakha, Jyaistha etc.

† In Kerala month names are also mentioned as Mesha, Vrishava etc. along with Medam, Edavan etc.

In determining the beginning of solar months, sunrise rule is followed in Orissa, Punjab, Haryana etc. *(day of transit of Sun)*, 18 ghatika rule in Kerala, sunset rule in Tamil Nadu and midnight rule in West Bengal.

J = Julian Calendar ; G = Gregorian Calendar

January 14, 2019 of Gregorian Calendar corresponds to January 1, 2019 of Julian Calendar.

Rules for finding Day of Week

The Weekday for any day of the year may be ascertained as follows :—

Rule :-Index for the century from the above table + Last two figures of the year + $\frac{1}{4}$th of last two figures (ignoring the remainder) = Y

Y + index for the month + date = Total.

Divide the total by 7 and take the remainder which indicates the day of week, *viz.*

if the remainder is 0 it is Saturday, 1 Sunday, 2 Monday, 3 Tuesday, 4 Wednesday, 5 Thursday, 6 Friday.

INDEX FOR THE MONTH

January = 1 (0 for a leap year)	April = 0	July = 0	October = 1
February = 4 (3 for a leap year)	May = 2	August = 3	November = 4
March = 4	June = 5	September = 6	December = 6

The Julian Calendar was established in the Roman Empire by Julius Caesar in 46 B.C. by revising the previous local calendars of Rome. In 1582, Pope Gregory XIII revised the calendar and ordained that Friday, October 5 of that year was to be counted as Friday, October 15.

In Great Britain 3rd Sept. 1752, Thursday of Julian Calendar was designated as 14th September, 1752, Thursday of Gregorian Calandar as the error in the Calendar then accumulated to 11 days.

Example : 1 — **To find the weekday of February 18, 1486 *(Birthday of Lord Shri Shri Chaitanya)*, of Julian Calendar.**

Index for the century 1400 of Julian Calendar is 4 from the above table. Index for the century is 4+last two figures of the year is 86+21 ($\frac{1}{4}$ th of 86)+4 (Index for month)+ 18(date)=133. Dividing by 7, the remainder is 0, which is Saturday.

Example : 2 — **To find the weekday of September 14, 1752 of Gregorian Calendar.**

Index for the century is 4 + last two figure of the year is 52 + 13 (1/4th of 52) + 6 (Index for the month) +14 (date)=89. Dividing by 7, the remainder is 5, which is Thursday.

Example : 3 — **To find the weekday of February 18, 1836. *(Birthday of Sri Ramakrishna)* of Gregorian Calendar.**

Index for the century (1800) = 2 + last 2 figure of the year = 36 + $\frac{1}{4}$ th of last two figures of 1836 = 9 = Y + Index for the month (February being leap year) +3 + date (18) = 68. Dividing by 7, the remainder is 5, which is Thursday. (According to Bengali Calendar the birthday is 6th Phalguna, 1242 B.S., Wednesday on Feb. 17, 1836 at 4 a.m. which is before sunrise. But according to Gregorian Calendar as the time is after midnight the date is Feb. 18, 1836 which is Thursday).

Example : 4 — **To find the weekday of January 1, 2020.** In a similar way the weekday of January 1, 2020 is found to be (6+20+5+0+1) = 32. Dividing by 7, the remainder is 4, which is Wednesday.

Maximum and Minimum Distance of Sun, Moon and Planets from the Earth

Planet	Maximum distance		Minimum distance		Planet	Maximum distance		Minimum distance	
	Miles	Kilometres	Miles	Kilometres		Miles	Kilometres	Miles	Kilometres
Sun	94600000	153400000	91500000	148400000	Jupiter	597000000	968000000	362000000	587000000
Moon	253000	410000	222000	360000	Saturn	1023000000	1659000000	773000000	1253000000
Mercury	136900000	222000000	49100000	79600000	Uranus	1946000000	3155000000	1594000000	2584000000
Venus	160900000	260900000	25700000	41700000	Neptune	2891000000	4690000000	2654000000	4303000000
Mars	247000000	400500000	34000000	55000000	Pluto	4506000000	7306000000	2605000000	4224000000

Duration of Daylight

The duration of twilight and daylight is determined according to the dates of four cardinal points *viz*, two equinoxes and two solstices. At equinoxes, the Sun's rays are perpendicular to the Equator. At solstices the Sun's rays are perpendicular either to the Tropic of Cancer $23\frac{1}{2}^{\circ}$ north of the equator or to the Tropic of Capricorn $23\frac{1}{2}^{\circ}$ south of the equator.

March 20-21 : On the day of *Vernal Equinox*, when the Sun's rays are perpendicular to the equator, the equator itself represents the daily path of the Sun, and consequently the two hemisphere are equally lighted and nights and days have the same duration at all latitude except at the Poles which are gazed by the Sun's rays for 24 hours. From 21st March onwards the length of daylight gradually increases in the Northern hemisphere and decreases in the Southern hemisphere. During 6 months' period from March 21 to Sept. 23, there is continuous daylight at the North Pole and continuous darkness at the South Pole.

June 21 : On the day of *Summer solstice*, when the Sun shines on the whole of Arctic Circle, the Suns's rays are perpendicular to the Tropic of Cancer $23\frac{1}{2}^{\circ}$ north of the equator. At that period duration of daylight at a place becomes longest for the year in the Northern hemisphere and duration of darkness is longest for the year in the Southern hemisphere.

September 22-23 : On the day of *Autumnal Equinox*, when the Sun's rays are perpendicular to the equator, the day and night again become equal at anywhere on the Earth's surface except at the Poles. During 6 months' period from Sept. 23 to March 21, there is continuous darkness at the North Pole and continuous daylight at the South Pole.

Dec. 21-22 : On the day of *Winter Solstice*, the Sun's rays are perpendicular to the Tropic of Capricorn $23\frac{1}{2}^{\circ}$ south of the equator. From the day of Winter Solstice when the North Pole is turned away from the Sun, the daylight gradually increases and the duration of night remain longer than day in the Northern hemisphere. In the Southern hemisphere duration of daylight gradually decreases but remain longer than night and finally day and night become equal on the Vernal Equinox day on March 20-21.

Daylight continues for 6 months at the North Pole from March 21 to September 23 and at that period darkness continues for 6 months at the South pole. Again from September 23 to March 21, darkness continues for 6 months at the North Pole and daylight for 6 months at the South Pole.

Duration of longest daylight or dark nights at different latitudes (North or South)

Latitude	Longest day or shortest night	Latitude	Longest day or shortest night
0° (Equator)	12 hours	67°.4	1 month
31°	14 hours	69°.8	2 months
49°	16 hours	78°.2	4 months
66°.5	24 hours	90° (Poles)	6 months

On the two equinox days the lengths of day and night are equal. But due to atmospheric refraction the Sun is seen to rise a few minutes earlier and to set a few minutes later than the calculated times and as a result the actual duration of the day is about 6 to 7 minutes longer than the calcualted times.

11	07	0

Daily motion of Mean Sun = 0° 59' 08.20" and Mean Rahu = (−)3' 10.7708"

Mean Ayanamsa for any date in 2020 = 24° 08' 11.00" + *precession* in longitude from 2020.0 to date.

True Ayanamsa = Mean Ayanamsa − *nutation* in longitude.

True Ayanamsa on Jan. 1, 2020 = 24°08'11.00"−16.49" = 24°07'54.51"

Miscellaneous Astronomical and Geographical Data

Figure of the Earth

Total area of the Earth	=	510 million sq. km
Land Surface (29.2%)	=	149 million sq. km
Water Surface (70.8%)	=	361 million sq. km
Equatorial circumference	=	40, 077 km = 24902.7 miles
Equatorial diameter	=	12, 756.8 km = 7926.72 miles
Equatorial radius	=	6, 378.140 km = 3963.20 miles
Polar diameter	=	12, 713.8 km = 7900 miles
Polar radius	=	6356,755 km = 3949.91 miles
Mass of the Earth	=	5.9742×10^{24} kg
Mass of the Moon	=	7.3483×10^{22} kg
Mass of the Sun	=	1.9891×10^{30} kg
Diameter of the Sun	=	1,392,530 km
Diameter of the Moon	=	3,476 km

Plane of our galaxy : Ascending Node = 8^s 6° 7'; Inclination = 60° 11'

Plane of galaxy from Pole (1950) $\alpha = 12^h\ 49.0^m$; $\delta = +27°\ 24'$

Centre of our galaxy : Long. $8^s2°$; Lat. = −6°, Light years = 26000

Astronomical Unit = 149, 597, 870 km. (The average distance between the Earth and the Sun)

Distance between each degree of longitude at the equator is 110 km (= 68 miles) approximately

Conversion Formula

Equations for converting Right Ascension and Declination to Geocentric Longitude and Latitude.

$$\text{Geocentric Longitude} = \tan\lambda = \frac{\sin\alpha\cos\varepsilon + \tan\delta\sin\varepsilon}{\cos\alpha}$$

$$\text{Geocentric Latitude} = \sin\beta = \sin\delta\cos\varepsilon - \cos\delta\sin\varepsilon\sin\alpha$$
$$= -\cos\delta\sin\varepsilon\sin\alpha + \sin\delta\cos\varepsilon$$

Where α = Right Ascension ; δ = Declination; ε = True obliquity of the ecliptic.

'KALIYUGA' DAY NUMBER (elapsed at Jan. 1, 2020, Ujjain Midnight) = 18,70,385 (completed)

Mean Length of the Tropical year (equinox to equinox)	= 365.242190*d*	= 365*d* 5*h* 48*m* 45.2*s*
Sidereal year (fixed star to fixed star)	= 365.256363*d*	= 365*d* 6*h* 9*m* 9.8*s*
Anomalistic year (perigee to perigee)	= 365.259636*d*	= 365*d* 6*h* 13*m* 52.6*s*
Eclipse year (nods to node)	= 346.620078*d*	= 346*d* 14*h* 52*m* 54.8*s*
Mean Length of the Synodic lunar month (new-moon to new-moon)	= 29.530589*d*	= 29*d* 12*h* 44*m* 02.9*s*
Tropical month (equinox to equinox)	= 27.321 582*d*	= 27*d* 7*h* 43*m* 04.7*s*
Sidereal month (fixed star to fixed star)	= 27.321 662*d*	= 27*d* 7*h* 43*m* 11.6*s*
Anomalistic month (perigee to perigee)	= 27.554 550*d*	= 27*d* 13*h* 18*m* 33.1*s*
Draconic month (node to node)	= 27.212 221*d*	= 27*d* 5*h* 5*m* 35.9*s*

Mean Length of the Day : 1 mean solar day = 1.002 737 909 35 mean sidereal days = 24*h* 03*m* 56.55537*s* of mean sidereal time.
1 mean sidereal day = 0.997 269 566 33 mean solar days = 23*h* 56*m* 04.090 53*s* of mean solar time.
Sidereal rotation period of the Earth = 23*h* 56*m* 04.999*s* mean solar time
Lunar day between the risings of the Moon = 24*h* 48*m* 45.838*s*
Mean duration of *tithi* = 23*h* 37*m* 28.096*s* Mean duration of *nakshatra* = 24*h* 17*m* 9.317*s*
Duration of tithi varies from 26*h* 47*m* to 19*h* 59*m*
Speed of the Earth moving around the Sun = 29.79 km. or 18.51 miles per sec. or roughly 66,600 miles per hour
Time to reach light on Earth from Sun is about 8.3 minutes and from Moon is about 1.3 seconds
Solar Parallax = 8.794148" ; Speed of light per sec. = 3,00,000 km (approx) 1,86,000 miles (approx) or 299,792.458 km in vacuous.
Solar motion = 20.0 km. or 12.4 miles per sec.
*Mean distance of Moon from the Earth = 384400 km. = 238856 miles (1 km. = 0.621372 miles)
Mean distance of Sun from the Earth is 930 lakh miles or 149.6 million km.

Entrance of Sun (☉) into Nakshatras, 2020

The timings of Sun's entry into different *nakshatra*-divisions are given below in I.S.T.

	Nakshatra		*d*	*h*	*m*
21	Uttarasada	Jan.	11	19	36
0	*Enters Abhijit*		21	15	16
22	Sravana		24	21	51
0	*Leaves Abhijit*		25	18	50
23	Dhanistha	Feb.	6	24	57
24	Satabhisaj		20	05	30
25	Purvabhadrapada	Mar.	4	11	43
26	Uttarabhadrapada		17	20	14
27	Revati		31	06	58
1	Asvini	Apr.	13	20	23
2	Bharani		27	12	08
3	Krittika	May	11	06	23
4	Rohini		24	26	33
5	Mrigasiras	Jun.	7	24	28
6	Ardra		21	23	28
7	Punarvasu	Jul.	5	23	04
8	Pusya		19	22	36
9	Aslesa	Aug.	2	21	29
10	Magha		16	19	11
11	Purvaphalguni		30	15	07
12	Uttarphalguni	Sep.	13	09	03
13	Hasta		26	24	29
14	Citra	Oct.	10	13	35
15	Swati		23	24	00
16	Vishakha	Nov.	6	08	14
17	Anuradha		19	14	12
18	Jyestha	Dec.	2	18	34
19	Mula		15	21	32
20	Purvasada		28	23	45
21	Uttarasada (2021)	Jan.	10	25	45

Entrance of Moon (☽) into Nirayana Signs *(Rasis)*, 2020 in I.S.T.

Interpolation

The longitudes of Moon and other fast moving planets calculated by the usual methods of simple proportion from their daily positions, for any intermediate hour of the day though fairly correct for our ordinary purposes are not strictly accurate. To obtain more precise result, further correction is to be applied to the longitude of planet already obtained by the rule of proportion.

Suppose *a. b. c. d* represent the longitudes of a planet for four successive days (for 5-30 a.m.I.S.T) and *l, m, n*, be the motions during the three intervals as indicated below. The longitude for any hour between the positions *b* and *c* is required to be calculated.

a	
	l
b	
	m
c	
	n
d	

Firstly find the longitude by utilising the position *b* and the daily motion *m* by the usual method.

Then apply interpolation. For this calculate (*n–l*) and take the result from the following table according to (*n-l*) and given time from 5-30 a. m. If (*n–l*) is positive, the correction would be negative and *vice versa*. *i.e.* the correction is of opposite sign to (*n–l*)

Correction due to second differences

Time interval	(*n–l*)									Time interval
	4'	8'	16'	24'	32'	40'	48'	56'	64'	
h *m*	0"	0"	0"	0' 0"	0' 0"	0' 0"	0' 0"	0' 0"	0' 0"	*h* *m*
0 18	1	2	3	0 5	0 6	0 8	0 9	0 11	0 12	24 00
0 37	2	3	6	0 9	0 12	0 15	0 18	0 21	0 24	23 42
0 56	2	5	9	0 14	0 18	0 23	0 27	0 32	0 36	23 23
1 16	3	6	12	0 18	0 24	0 30	0 36	0 42	0 48	23 04
1 36	4	8	15	0 23	0 30	0 38	0 45	0 53	1 0	22 44

2 20	5	11	21	0 32	0 42	0 53	1 3	1 14	1 24	22 02
2 42	6	12	24	0 36	0 48	1 0	1 12	1 24	1 36	21 40
3 06	7	14	27	0 41	0 54	1 8	1 21	1 35	1 48	21 18
3 31	7	15	30	0 45	1 0	1 15	1 30	1 45	2 0	20 54
3 57	8	17	33	0 50	1 6	1 23	1 39	1 56	2 12	20 29
4 25	9	18	36	0 54	1 12	1 30	1 48	2 6	2 24	20 03
4 54	10	20	39	0 59	1 18	1 38	1 57	2 17	2 36	19 35
5 26	10	21	42	1 3	1 24	1 45	2 6	2 27	2 48	19 06
6 00	11	23	45	1 8	1 30	1 53	2 15	2 38	3 0	18 34
6 38	12	24	48	1 12	1 36	2 0	2 24	2 48	3 12	18 00
7 21	13	25	51	1 17	1 42	2 8	2 33	2 59	3 24	17 22
8 12	13	27	54	1 21	1 48	2 15	2 42	3 9	3 36	16 39
9 19	14	29	57	1 26	1 54	2 23	2 51	3 20	3 48	15 48
12 00	15	30	60	1 30	2 0	2 30	3 0	3 30	4 0	14 41 12 00

Method of Calculation

Example : Find the longitude of Moon on March 22, 2020 at 5-30 p.m. I.S.T. from the given positions of Moon at 5-30 a.m. I.S.T. For this purpose positions of Moon from Mar. 21 to Mar. 24 are given below.

Longitude of Moon at 5-30 a. m. I.S.T

2020						Diff.			
			s	°	'	"	°	'	"	
Mar.	21	=	9	29	34	42	11	59	47	(= *l*)
	22	=	10	11	34	29	11	55	35	(= *m*) (*n–l*) = – 06' 41"
	23	=	10	23	30	04	11	53	06	(= *n*)
	24	=	11	05	23	10				

Moon's longitude on Mar. 22 at 5-30 a.m. I.S.T. = 10^{s} 11° 34' 29". Daily motion of Moon on that date = 11° 55' 35". By rule of proportion or by using Log. tables, the position of Moon at 5-30 p.m. I.S.T. is found to be 10^{s} 17° 32' 17" by applying 12 hour's motion. The time interval from 5-30 a.m. is 12 hours. To obtain accuracy, correction due to *Second differences* according to time interval of 12 hours and (*n–l*) which is (–) 06'41" is to be taken. From the Table given above, we get *second difference correction* as (+) 0'24". The correction will be of opposite sign to (*n–l*). So the final result is 10^{s} 17° 32' 41" on Mar. 22 at 5-30 p.m. I.S.T. which tallies with the actual figure.

Movement and Visibility of Planets, 2020

Mercury (☿) can only be seen low in the east before sunrise or low in the west after sunset. It is visible in the evening sky between the following approximate dates : Jan. 26 to Feb.19, May13 to Jun.21, Sep.2 to Oct.16, 2020. The planet is brighter at the end of each period. At the beginning of the year it is in ***Dhanus Rasi*** (***constellation of Sagittarius***) and moving through different Rasis remain in ***same Rasi*** (***Sagittarius***) at the end of the year. It is visible in the morning sky between the following approximate dates : Mar. 2 to Apr. 17, Jul. 10 to Aug.7, Oct.30 to Nov.30, 2020.The planet is brighter at the beginning of each period. Mercury is Retrograde from Feb.17 to Mar.9, Jun.18 to Jul. 11,Oct.14 to Nov.2. Mercury is in conjunction with Venus on May 22, with Jupiter on Jan. 2 and with Saturn on Jan.12, 2020.

Venus (♀) is a brilliant object in the evening sky from the beginning of the year until the last week of May where it becomes too close to the Sun for observation. It reappears in the second week of Jun. in the morning sky where it stays until the end of the year. Venus is Retrograde from May 13 to Jun. 24. It is in conjunction with Mercury on May 22, 2020. At the beginning of the year it is in ***Makara Rasi (Capricornus)*** and moving through different ***Rasis*** it is in ***Vriscika Rasi(Scorpio)*** at the end of the year. It attains maximum brilliancy of – 4·7 from Apr. 16 to May 11, 2020.

Mars (♂) rises well before sunrise at the beginning of the year, when it can only be seen in the morning sky. It is in opposition with Sun on Oct. 13 when it can be seen throughout the night. At the beginning of the year it is in ***Vriscika Rasi*** (***Capricornus***) and moving through different Rasis it is in ***Mesha Rasi*** (Aries) at the end of the year. It is in conjunction with Jupiter on Mar. 20 with Saturn on Mar.31, It is 4°.82' N of Antares on Jan. 17. Mars is Retrograde from Sep.9 to Nov.13, 2020.

Jupiter (♃) is visible in the morning sky at the beginning of the year. It is in opposition with Sun on Jul. 14, when it is visible throughout the night. At the beginning of the year it is in ***Dhanus Rasi (Sagittarius)*** and enters in ***Makara Rasi*** (***Capricornus***) in the last week of November.It is visible in the evening sky in the middle of October. Jupiter is Retrograde from May 14 to Sep. 12. It is in conjunction with Mercury on Jan. 2,with Mars on Mar.20 and with Saturn on Dec.21,2020.

Saturn (♄) is visible in the morning sky at the beginning of the year. It is in opposition with Sun on Jul.20 when it is visible throughout the night. From last week of October it can only be seen in the evening sky. Saturn is Retrograde from May 11 to Sep. 28. It enters in ***Makara Rasi (Capricornus)*** in the last week of Jan. and remains in same Rasi during the year. It is in conjunction with Mercury on Jan.12 Mars on Mar. 31, with Jupiter on Dec.21, 2020.

Uranus, Neptune and Pluto are not visible in the naked eye.

Planets at Minimum and Maximum distances from the Earth, 2020

Nearest to the Earth (Near about opposition with the Sun)				Farthest from the Earth (Near about conjunction with the Sun)			
Planet	Date	True Distance	Potency	Planet	Date	True Distance	Potency
	d h m				*d h m*		
Sun	Jan. 5 21 04	0·983	1·000	Sun	Jul. 4 18 11	1·016	0·967
Mercury	–	–	–	Mercury	Jan. 10 28 24	1.432	0.382
	Feb. 27 09 04	0·637	0·860		May 4 26 48	1·326	0·413
	Jul. 1 27 28	0·562	0·975		Aug. 18 06 52	1·350	0·405
	Oct. 25 25 38	0·668	0·820		Dec. 21 13 19	1·447	0·378
Venus	Jun. 3 29 23	0.400	0.666	Venus	–	–	–
Mars	Oct. 13 28 56	0.418	0.889	Mars	–	–	–
Jupiter	Jul. 15 15 49	4·139	0·954	Jupiter	–	–	–
Saturn	Jul. 21 08 22	8.994	0·893	Saturn	Jan. 13 18 20	11·016	0·729

Note:— The distance are in units of the mean distance of the Sun from the Earth taken as 1·000.

Potency or power of a planet that it exerts on us is taken as 1.00 when at the minimum possible distance from the Earth and decreases inversely as the distance increases. The least distance adopted are : Sun 0·983, Mercury 0·548, Venus 0·264, Mars 0·372 , Jupiter 3·951 and Saturn 8·039.

One astronomical unit is 149,597,870 k.m. (the average distance between the Earth and the Sun). Mean distance of the Sun from the Earth is 930 lakh miles. or 149.6 million Kms.

Time to reach light on Earth from the Sun is about 8·3 minutes and from Moon is about 1·3 seconds.

Visibility of JUPITER and SATURN

Dates of heliacal setting

JUPITER

Set	Rise
—	— Jan. 9

Visual magnitude varies from –1.8 to –2.7. Maximum –2.7 from Jun. 20 to Aug. 9.

SATURN

Set	Rise
—	— Jan. 30

Visual magnitude varies from +0.5 to +0.7. Maximum +0.7 from Mar. 2 to Apr. 1.

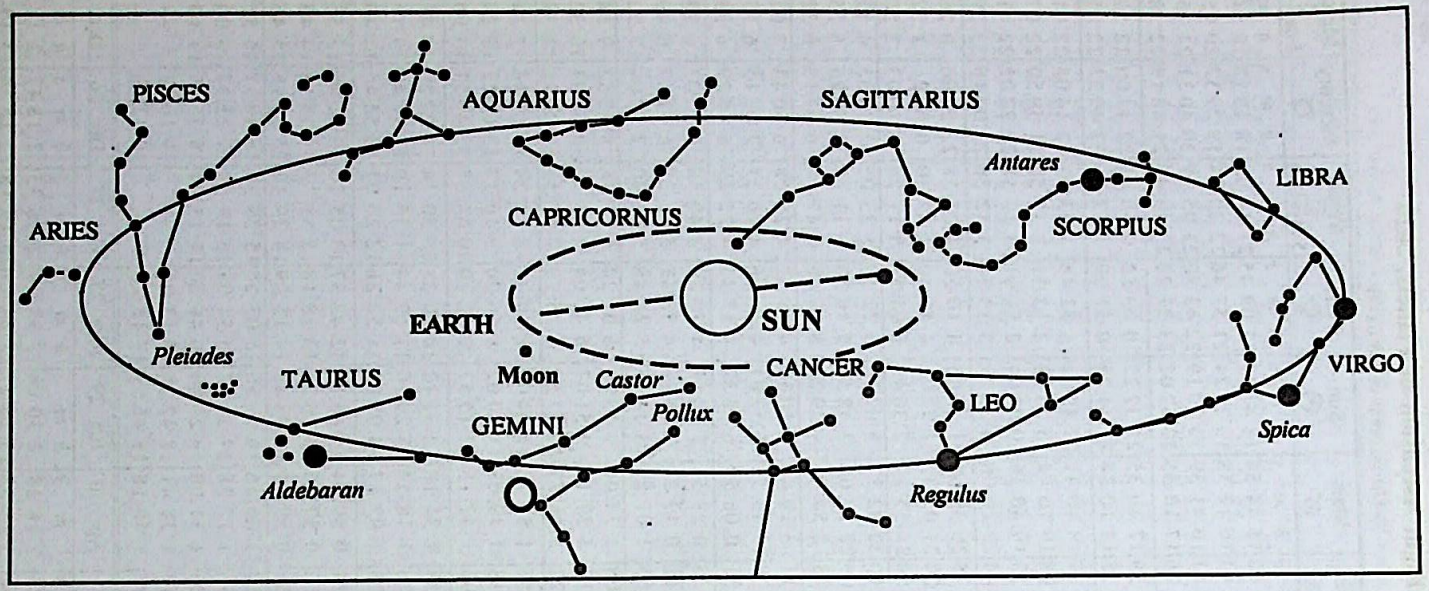
YEARLY JOURNEY OF THE EARTH



The Earth whose average distance from the Sun is 93 million miles or 149.6 million kms. revolves round the Sun continuously in elliptical orbit and complete the circuit in 365.25636 days (Sidereal Period) at a speed of 18.51 miles or 29.79 km. per second or roughly 66,600 miles per hour. The mean plane of the Earth's orbit around the Sun is known as *ecliptic.*

The moon makes one complete circuit of the Earth in 27.3 days (Appox.). Average distance of Moon from the Earth is 2.39 lakh miles or 3,84,400 km.

The planet Mercury which is nearest to the Sun takes only 88 days to travel right round the Sun. The time taken by other planets to travel round the Sun is Venus 225 days, Mars 1.9 years, Jupiter 11.86 years, Saturn 29.46 years, Uranus 84.02 years, Neptune 164.77 years and Pluto 248.42 years.

KARANA—2020

In each *Tithi* there are two *Karanas* covering the two halves of the *tithimana*, the first *Karana* ends at the middle time of the *tithi* and the second *Karana* ends with the ending of that *tithi*. A *Karana* is completed when the nirayana longitude of the Moon gains every 6° (degrees) on that of the Sun. The ending times of each *Karana* are given below as are current at 5-30 a.m. I.S.T. in *hours* and *minutes*.

Date	Ending time of Karanas
Jan. 1	Taitila *h* 18-28
2	Gara *h* 7-44 then Vanija *h* 21-01
3	Vishti *h* 10-14 then Bava *h* 23-27
4	Balava *h* 12-30 then Kaulava *h* 25-33
5	Taitila *h* 14-20 then Gara *h* 27-07
6	Vanija *h* 15-35 then Vishti *h* 28-03
7	Bava *h* 16-09 then Balava *h* 28-15
8	Kaulava *h* 16-00 then Taitila *h* 27-44
9	Gara *h* 15-10 then Vanija *h* 26-35
10	Vishti *h* 13-43 then Bava *h* 24-51
11	Balava *h* 11-46 then Kaulava *h* 22-41
12	Taitila *h* 9-27 then Gara *h* 20-12
13	Vanija *h* 6-48 then Vishti *h* 17-33 then Bava *h* 28-11
14	Balava *h* 14-50 then Kaulava *h* 25-30
15	Taitila *h* 12-11 then Gara *h* 22-56
16	Vanija *h* 9-42 then Vishti *h* 20-35
17	Bava *h* 7-28 then Balava *h* 18-31
18	Kaulava *h* 5-34 then Taitila *h* 16-47 then Gara *h* 28-01
19	Vanija *h* 15-26 then Vishti *h* 26-52
20	Bava *h* 14-29 then Balava *h* 26-06

Aspects & Phenomena, 2020 A.D.

Approximate time of the formation of Aspects and Phenomena in I.S.T.

Aspects :— Conjunction or on the same degree of longitude — ☌, Semi sextile or 30° apart — ⚺, 1st Nonile 40°, Semi-square 45° — ∠, Sextile 60° — ⚹, Quintile 72° — Q, 2nd Nonile 80°, Square 90° — □, Trine 120° —△, Sesquiquadrate 135° —⊡, Quincunc 150°, 4th Nonile — 160°, Opposition 180° — ☍ Parallel (*i.e.*, equality of declination) on the same side of the equator — P, on opposite sides — p. When the tropical or sayana longitudes of two planets are supplementary — V (*i.e.*, the sum is 180°) or v (*i.e.*, their sum is 360°).

The mutual aspects as mentioned above of the Sun, Mercury, Venus, Mars, Jupiter, Saturn, Uranus, Neptune, Pluto and Rahu (True) together with Moon's conjunctions, sextiles, quadratures, trines and oppositions with all the planets and also the parallels and V-aspects with the Sun have been shown with the *approximate time* of their formation given in Indian Standard time recorded from 5-30 a.m. to 29*h* 29*m* next morning within the same date. In case of conjunctions the distances apart in declination of the second mentioned planet with respect to first one have also been stated in some cases in degrees and minutes.

Heliocentric conjunctions and oppositions of planets (Mercury to Neptune) and their quadratures with the Earth have been shown prefixed by the word *'Helio'*.

Phenomena include Perihelion and Aphelion (*viz.* planet at minimum and maximum linear distance from the Sun), Perigee and Apogee (in case of Sun and Moon from the Earth), Node N and Node S (*i.e.* the planet is crossing the ecliptic towards North or South), planet □ its Node, *i.e.* at greatest helio lat., planet on Equator, maximum declination of Moon, Stationary (Direct or Retrograde), greatest elongation of Mercury and Venus from the Sun, Mars nearest Earth and conjunctions of Moon and Planets with bright stars etc. and greatest brilliancy of Venus.

Note— The 'Nonile' aspect which are formed at distances of 40° (1st nonile), 80° (2nd nonile), 120° (3rd nonile or trine) and 160° (4th nonile) are on the basis of one-ninth division of the circle of twelve *navamshas*. When two planets form the 'Nonile' aspect, they are in true conjunction in the *navamsha* chart.

The V-aspects of the Sun and the Moon, used by the ancient Indian astronomers, are of two kinds *viz.* the *Vyatipata* aspect when the sum of the tropical longitudes of the Sun and the Moon amounted to 180° (symbol—V), and the *Vaidhriti* aspect when it amounted to 360° (symbol—v). These aspects mutually between all other planets also have been shown. These two V-aspects like conjunctions and oppositions have a very close of affinity with the parallel aspects, and latter generally taking place very near to the former four.

The ***heliocentric aspects*** are with reference to the places of planets as may be seen by an observer stationed in the Sun. Of these aspects, the conjunctions and oppositions are the most important. When two planets form the opposition aspect heliocentrically, both the planets are at that time invisible to each other having been intervened by the Sun situated between them. In case of conjunctions, the outer planets is visible to the inner one, but the inner planet is not visible to the outer. This phenomena is similar to combustion or heliacal setting of planets as we see from the planet Earth.

ECLIPSES, 2020

In the year 2020, there are two eclipses of the Sun. Details of the eclipses are given below in I. S. T.

	ANNULAR SOLAR ECLIPSE	TOTAL SOLAR ECLIPSE
	Jun.21 Sunday	Dec. 14 Monday
	h *m*	*h* *m*
Eclipse begins	09 16	19 04
Totality or Annularity begins	10 19	20 03
Maximum of Eclipse (Central Eclipse at local apparent noon)	12 10	21 44
Totality or Annularity ends	14 02	23 24
Eclipse ends	15 04	24 23
Moon enters penumbra	—	—
Moon leaves penumbra	—	—
New Moon or Full Moon	12 11 N.M.	21 47N.M.
Moon's Latitude	+0° 20'	+1° 56'
Moon's Longitude	2^{s} 06° 46'	7^{s} 27° 04'
Moon – *Rahu* (Asc. Node)	1° 47'	181° 16'
Total duration	5^{h} 48^{m}	5^{h} 19^{m}
Magnitude	0.9936	1.0245
Conjunction or Opposition in R.A.	12^{h} 11^{m}	21^{h} 48^{m}
Visibility in India	Visible	Not Visible

N.B.— Times of beginning and ending of eclipses as shown above relate to the Earth as a whole and not to any particular locality.

AREA OF VISIBILITY OF ECLIPSES

1. **Annular Solar Eclipse, June 21, Sunday :** The Eclipse is visible in the region covering Africa (except Western and Southern parts) South Eastern Europe, Middle East, Asia (except Northern and Eastern parts of Russia), Indonesia, Micronesia.The Eclipse will be visible in India.

ANNULAR SOLAR ECLIPSE, JUNE 21, 2020
LOCAL CIRCUMSTANCES OF THE PARTIAL PHASE RELATING TO CERTAIN PLACES IN INDIA

Places	Partial Eclipse Begins (I.S.T.)		Greatest Eclipse (I.S.T.)		Magnitude	Partial Eclipse Ends (I.S.T.)

Sunrise and Sunset (*upper limb*) for certain places in India, 2020

(Indian Standard Time)

The timings of Sunrise and Sunset shown in the following pages relate to the visibility of the upper limb of the Sun on the horizon and include refraction and limb correction amounting to a total of about $3\frac{1}{2}$ mins. (3 mins. for 0° or 10° lat. and 4 mins. for 30° or 35° lat.)

The timings relate to the visibility of the upper limb of the Sun on the horizon, and as such include refraction and limb-correction amounting to a total of about 3½ mins. (3 mins. for 0° or 10° lat., and 4 mins. for 30° or 35° lat.). For this reason the above times have been obtained by *diminishing* the calculated figures by the above amount for sunrise and *increasing* for sunset.

The L.M.T. of rise and set for intermediate latitudes and dates may be obtained by simple proportion. Thereafter, the timings can be converted into I.S.T. by inverse application of the local time correction for the place.

The timings relate to the visibility of the upper limb of the Sun on the horizon, and as such include refraction and limb-correction amounting to a total of about 3½ mins. (3 mins. for 0° or 10° lat., and 4 mins. for 30° or 35° lat.). For this reason the above times have been obtained by *diminishing* the calculated figures by the above amount for sunrise and *increasing* for sunset.

The L.M.T. of rise and set for intermediate latitudes and dates may be obtained by simple proportion. Thereafter, the timings can be converted into I.S.T. by inverse application of the local time correction for the place.

N.B. —To calculate the times of Moonrise and Moonset for Kolkata and eastern India *subtract* 1 minute in the times of L.M.T. and for Delhi, Mumbai, Chennai etc. and western India *add* 1 minute to get the corrected L.M.T. for the required Meridian.

N.B. —From the corrected L. M. T. calculate for the exact latitude of the required place by interpolation when the place is between 10° N. and 30° N. and by extrapolation when the place falls outside 10° N. or 30° N. Lat.

N.B.—The L.M.T. thus obtained for the latitude of the place may now be converted into I.S.T. by inverse application of the local time correction for the place.

Method for Calculation of Sunrise, Sunset and Moonrise, Moonset times from the Tables given in this Ephemeris.

Sunrise & Sunset

Example : To find the times of Sunrise and Sunset in I.S.T at **Hyderabad** on June 1, 2020 from the given table of Local Mean Time of Sunrise & Sunset.

Place : **Hyderabad** : Latitude = 17° N 26' = 10°+ 7°26' = 10°+ 7.43°
Interpolation factor for the Latitude = .743 for 1° difference
Longitude = 78° E 27'
Correction to obtain I.S.T. from L.M.T = (+) 16m 12s = (+) 16.2m

The latitude of Hyderabad is 17° N 26' which lies between 10° & 20° North Latitude.
The time of Sunrise and Sunset for Lat. 17°N 26' on June 1, would be as follows :

Sunrise in L.M.T.			
Latitude	+ 10°	+ 20°	*Diff.*
June 1 =	$5^h\,38^m$	$5^h\,20^m$	-18^m
Sunrise in L.M.T. = $5^h\,38^m$ (–) (.743× 18m)			
= $5^h\,38^m$ (–) 13.3m		=	$5^h\,24.7^m$
Corr. to obtain I.S.T.		=	+ 16.2m
Sunrise in I.S.T. (upper limb)		=	$5^h\,40.9^m$
(rounded to minute)		=	$5^h\,41^m$

Sunset in L.M.T.			
Latitude	+ 10°	+ 20°	*Diff.*
June 1 =	$18^h\,18^m$	$18^h\,36^m$	$+18^m$
Sunset in L.M.T. = $18^h\,18^m$ (+) (.743 × 18m)			
=18^h18^m (+) 13.3m		=	$18^h31.3^m$
Corr. to obtain I.S.T.		=	+ 16.2m
Sunset in I.S.T. (upper limb)		=	$18^h47.5^m$
(rounded to minute).		=	$18^h\,48^m$

Sun rises at $5^h\,41^m$ and sets at $18^h\,48^m$ at Hyderabad on June 1, 2020.

Moonrise & Moonset

Example : To find the times of Moonrise and Moonset in I.S.T at **Delhi** on May 24, 2020 from the given table of Local Mean Time of Moonrise and Moonset.

Place : **Delhi** : Latitude = 28°N 39' = 20°+ 8°39' = 20°+ 8.65°
Interpolation factor for the Latitude = .865 for 1° difference
Longitude = 77° E 13'
Correction to obtain I.S.T. from L.M.T = + 21m 08s = + 21.1m

The latitude of Delhi is 28°N 39' which lies between 20° & 30° North Latitude.
The time of Moonrise and Moonset for lat. 28°N 39' on May 24, would be as follows :

Moonrise in L.M.T.			
Latitude	+ 20°	+ 30°	*Diff.*
May 24 =	$6^h\,28^m$	$6^h\,07^m$	-21^m
Moonrise in L.M.T.= 6^h28^m (–) (.865 × 21m)			
= 6^h28^m (–) 18.2m		=	$6^h\,09.8^m$
Corr. to obtain I.S.T		=	(+) 21.1m
Moonrise in I. S. T. (upper limb)		=	$6^h\,30.9^m$
(rounded to minute)		=	$6^h\,31^m$

Moonset in L.M.T.			
Latitude	+ 20°	+ 30°	*Diff.*
May 24 =	$20^h\,04^m$	$20^h\,26^m$	$+22^m$
Moonset in L.M.T. = $20^h\,04^m$ (+) (.865 × 22m)			
= $20^h\,04^m$ (+) 15.0m=			$20^h\,23^m$
Corr. to obtain I.S.T		=	(+) 21.1m
Moonset in I. S. T. (upper limb)		=	$20^h\,44.1^m$
(rounded to minute)		=	$20^h\,44^m$

Moon rises at $6^h\,31^m$ and sets at $20^h\,44^m$ at Delhi on May 24, 2020.

* For greater accuracy a correction of 1 minute for the Meridian of the place is required to be taken and the same is to be *subtracted* for places in eastern India and 1 minute to be *added* for places in western India.

Solar Return or *Varsapraves*

The moment in each year when the nirayana or sidereal longitude of the Sun becomes equal to the longitude of Sun at the time of birth of the native is the moment of Solar return or *Varsapravesh.*

Short method of calculation :- Wirte down the day of week at birth (*0 for Saturday, 1 for Sunday, etc.)* and with it write the birth time reckoned from 6*h* a.m. or 0^h midnight or in any other system of time reckoning. Take from the following table the figures given against the age of the person (completed number of years) and add to the above. The result gives the day of week and the time of *Varsapravesh.* The English date for the table below may differ by a few minutes from that obtained from equality of longitudes of the Sun at the two epochs, this being due to the perturbations of Sun's longitude caused by the planets. Actually calculation of equality of longitude of Sun will give the exact time of *Varsapravesh.*

Year	*d*	*h*	*m*	Year	*d*	*h*	*m*	Year	*d*	*h*	*m*
1	1	6	9.2	41	2	12	15.7	81	3	18	22.1

24	2	3	39.9	64	3	9	46.4	104	4	15	52.8
25	3	9	49.1	65	4	15	55.6	105	5	22	2.0
26	4	15	58.2	66	5	22	4.7	106	0	4	11.2
27	5	22	7.4	67	0	4	13.9	107	1	10	20.3
28	0	4	16.5	68	1	10	23.0	108	2	16	29.5
29	1	10	25.7	69	2	16	32.2	109	3	22	38.7
30	2	16	34.9	70	3	22	41.4	110	5	4	47.8
31	3	22	44.0	71	5	4	50.5	111	6	10	57.0
32	5	4	53.2	72	6	10	59.7	112	0	17	6.1
33	6	11	2.4	73	0	17	8.9	113	1	23	15.3
34	0	17	11.5	74	1	23	18.0	114	3	5	24.5
35	1	23	20.7	75	3	5	27.2	115	4	11	33.6
36	3	5	29.8	76	4	11	36.3	116	5	17	42.8
37	4	11	39.0	77	5	17	45.5	117	6	23	52.0
38	5	17	48.2	78	6	23	54.7	118	1	6	1.1
39	6	23	57.3	79	1	6	3.8	119	2	12	10.3
40	1	6	6.5	80	2	12	13.0	120	3	18	19.4

Example: A child is born on September 12,1993, Thursday at 16*h* 35*m* I.S.T. What will be the moment of solar return on September 12, 2020. Weekday on September 12, 1993 was Thursday viz. (= 5). Completed number of years of the nativity is 27. As per above Table, against the year 27, we get 5*d* 22*h* 07*m*. Adding to the September 12, 1993 which is Thursday (= 5), we get the weekday (5 + 5 = 10) which becomes Tuesday and adding 22*h* 07*m*, to birthtime 16*h* 35*m*, we get 14*h* 42*m* on September 13, 2020, Monday which is the time of *Varsapravesh* (Actual time is 14*h* 42*m*).

AYANAMSA CORRECTION

(Correction for precession *i.e.* for yearly variation of *ayanamsa*)

The corrections are for the middle of the year.

After obtaining from the tables the exact value of the Ascendant or the Tenth house (in degrees and mins.) for the given time and place, the following correction for the year in question should be applied to the result.

Year	Correction	Year	Correction	Year	Correction	Year	Correction	Year	Correction
A.D.	° '	A.D.	° '	A.D.	° '	A.D.	° '	A.D.	° '

Rule : To obtain the rising and setting-times of the Sun, Moon etc., *firstly* find the time of its meridian passage. In case of Sun the apparent noon is the Meridian Passage time. In case of Moon the tabulated M. Pass. time is required to be interpolated to the approximate time of its rising or setting by subtraction or addition of about 12 minutes. A star passes the meridian when the sidereal time of the moment becomes equal to the Right Ascension of the star. Then find the semi-diurnal Arc which is as follows :—

Semi-diur. Arc = 6h ± Asc. diff. [*positive* sign is to be taken when the declination is North, and *negative* sign when the declination is South].

Local mean time of rising = M. Pass. – Semi-diur. Arc.

Local mean time of setting = M. Pass. + Semi-diur. Arc.

N. B. —If the latitude of place is South reverse the *sign* of declination and work.

Example : To find the times of Sunrise and Sunset at Kolkata on Jan. 1, 2020 :

The meridian passage of the Sun (apparent noon) on Jan. 1, 2020 is $12^h\ 03^m 12^s$. Deducting $23^m\ 30^s$ the time in I.S.T. will be $11^h\ 39^m\ 42^s$. Declination of Sun on that day is 23° 03' South. According to Declination 23° 03', the Ascensional Difference for Lat. 22°N35' will be nearly $40^m\ 42^s$ for the place Kolkata as obtained from the above Table. Therefore Semi-diur. arc will be 6^h (–) $40^m\ 42^s = 5^h\ 19^m\ 18^s$.

Time of Rising in I.S.T. = $11^h\ 39^m\ 42^s$ (–) $5^h\ 19^m\ 18^s = 6^h\ 20^m\ 24^s$

Time of Setting in I.S.T. = $11^h\ 39^m\ 42^s$ (+) $5^h\ 19^m\ 18^s = 16^h\ 59^m\ 00^s$

Applying correction of about (–) $3^m\ 30^s$ for rise for upper limb and for set, for upper limb the sunrise time will be $6^h\ 16^m\ 54^s$ and sunset time will be $17^h\ 02^m\ 30^s$ (rounded to $6^h\ 17^m$ and $17^h\ 03^m$ respectively).

The time of rising and setting of planets may also be found out in the same process.

Tables of Ascendants *(Nirayana)*

The following tables give the ASCENDANT *(Lagna)* for 9 places and the TENTH HOUSE for all places at an interval of 10 degrees according to the *Nirayana* system, when the Sidereal Time for the given moment is known. The tables, which are prepared for the year 2020, may be utilised for a few years past and future without entailing any appreciable amount of error. These tables are applicable for all places on the earth lying on the same geographic latitudes as given below. It must be noted that in finding the sidereal time for a moment, the *local mean time* should be used and not the standard time. For finding out the Ascendant of other places, the book *Tables of Ascendants* by N. C. Lahiri may be used. An example showing the procedure for finding out the *Lagna* (Ascendant) and *Dasama* (Tenth House) for a place is shown on the next page.

2020 : Correction for Sidereal Time = $-0m\ 14s$ (for Jan. and Feb.) = $+3m\ 42s$ (for Mar.To Dec.)

2020 : Correction for Ayanamsa = $-1^{\circ}\ 09'$

TENTH HOUSE OR ASCENDANT	Tenth House for all places	ASCENDANT FOR

Tables of Ascendants *(Nirayana)—contd.*

Example : To find the Ascendant *(Lagna)* and Tenth House *(Dasama)* for Delhi (Lat. 28°N 39', Long. 77°E 13') on 20th April, 2020. A.D. at 20*h* 16*m* I.S.T. (Time of transit of tropical Sun to Taurus). The time in L.M.T. of the place is I.S.T. (–) 21*m* 08s. So the given time in L.M.T. is 19*h* 54*m* 52s of 20th April. The time occurs 7*h* 54*m* 52*s* after 12h Noon of 20th April. Sidereal Time on 20th April, 2020 A.D. at 12h Noon is 1*h* 55*m* 15*s*. By applying correction for Delhi (+3s), the Sidereal Time at 12h Noon is *1h 55m 18s*. As the time in L.M.T. occurs 7*h* 54*m* 52*s* after Noon, the same has been added to Sidereal Time with necessary correction. The correction is 10 seconds per hour. So the corrected time is 7*h* 54*m* 52*s* +80s = 7*h* 56*m* 12*s*.

The Sidereal Time of the moment will be therefore be 1*h* 55*m* 18*s* (+) 7*h* 56*m* 12*s* = 9*h* 51*m* 30*s* Now from the book *'Tables of Ascendants'* by N. C. Lahiri using the table for Delhi : for Lat. 28°N 39' according to Sidereal Time 9*h* 51*m* 30*s*, the Ascendant is 6[s] 27°12*m*. Applying Ayanamsa Corr. (–) 1° 09' the Ascendants comes out 6[s] 26°03[m] i.e. Tula 26° 03'. Similarly with the same sidereal Time *viz.* 9*h* 51*m* 30*s*, the Tenth House is obtained as 4[s] 02° 36[m]. Applyeing Ayanamsa Corr. (–) 1° 09' Tenth House comes out 4[s] 01° 27[m] *i.e.* Simha 01° 27'.

Latitude, Longitude and Local Time corrections of principal cities in India

The following table gives the latitude and longitude of principal cities along with the Local Time correction, *viz*, the reduction of Indian Standard Time to get the corresponding local mean time of the place.The local mean time (L.M.T.) is required in determining the sidereal time of a moment which is utilised in finding the Ascendant *(lagna)* and the tenth house *(Dasama)*.

The corrections in the last column when applied to the sidereal time as obtained in the daily Ephemeris will give the sidereal time for 12*h* noon L.M.T. of the place in question. When the Greenwich time for any day is available, the corrections are to be diminished by 54 secs. before applying the same to the Greenwich sidereal time.

PLACE			Latitude North		Longitude East		Local Time Correction L.M.T. from I.S.T		Corr. to *Indian* Sid. Time

Note :- Correction to get *Indian Sidereal Time* is obtained at the rate of 0.66 seconds per degree of longitude from the *Central Meridian of India* (*viz*, 82°E 30') and positive for west and negative for east *e.g.*, for Delhi, longitude is 77°E 13'. Difference from Central Meridian of India (*viz*. 82°E 30') is 5°17'. Multiplying 5°17' by 0.66 sec., the result is +3*s*.

Standard Time of India

Central Meridian of India

The International Time Zone is based on 24 Standard Meridians each 15° of arc or one hour in time appart, starting from Greenwich meridian comprising of 360° degrees. All places within these Standard Meridians having the same Standard time is regarded as the most scientific system and leads to World uniformity.

The local time of a place in a country differs from place to place which is determined according to longitude of the place. Though the use of local time is most scientific, but it leads t o endless confusion for civil purposes. In India, where longitudinal extent is between 68°07' to 97°25'E. Long. the local time obtained from the longitudes of places varies nearly from 4*h* 32*m* to 6*h* 30*m*. *So adoption of local time for civil purposes is found to be most inconvenient.* To avoid the inconveniences the local time of the central place of the country has been taken and the Central Meridian of India has been selected at a place having 82°30' East longitude and 23°11' North latitude (latitude of Ujjain).

This time is adopted as the Indian Standard Time which is related to the local mean time of 82°30'E meridian which is 5*h* 30*m* ahead of Greenwich.

Cities of Bangladesh and Pakistan

The corrections to get the local time (L.M.T.) for cities in Bangladesh and Pakistan are given with reference to the Zonal Standard Time (6*h* ahead of G.M.T. for Bangladesh and 5*h* for Pakistan) and also with reference to the Indian Standard Time (5$^{1}/_{2}$ *h* ahead of G.M.T.).

Bangladesh (formerly East Pakistan) observed Bengal Time (6$^{1}/_{2}$^{h} ahead of G.M.T.) for civil purposes and Pakistan Standard time same as I.S.T., for Railway and Postal work etc. up to 30-9-51. From 1st October 1951 East Pakistan (now Bangladesh) Standard Time is 30 minutes more than I.S.T. and West Pakistan (now Pakistan) Standard Time is 30 minutes less than I.S.T.

LOCAL TIME OF SOME FOREIGN CITIES

The adopted Zonal Standard Times of the territories with reference to which the local time corrections for the cities and the reductions to I.S.T have been given are those as in current use. It is likely that before and during the war period some of these standard times were different, but it has not been possible to indicate here all such changes.

In many countries summer time is kept, *i.e.* during the summer months the clocks are advanced usually by one hour. If the recorded time of the event is summer time, it should be converted into the normal standard time of the territory or zone by making necessary correction (generally *minus* 1 hr.) before the reductions for local time and I.S.T. are applied.

(The countries observing Summer Time or Day Light Saving Time during the summer months are marked with asterisks). Detailed information of countries which are observing Summer Time are shown under "Period of Summer Time of Different Countries"

N. B. Fig. in col.(5) =Excess of I.S.T. over L. M. T.

Time Zone + Corr. for I.S.T. from Z.S.T. = $5h\ 30m$

Example for finding I. S. T. and Indian Sidereal time corrections

Example *Place*: New York (Long. 74° 00'W). Time Zone is $-5h$

L.M.T. from Z.S.T. = $74°0' \times 4m = 296m\ 0s = 4h\ 56m$

diff. of L. M. T and Z. S. T. = $+4m\ 0s$

I. S. T. from Z. S. T. = $-5h - 5h\ 30m = +10h\ 30m$

Corr. to Indian Sidereal Time for New York = Difference of long. of the place 74°0'W and 82°30'E = 156°30' = 156°.5'. Multiplying by 0.66 seconds, the correction is $+ 1m\ 43s$

EPHEMERIS TIME

Due to tidal friction on the Earth's surface there has been regular retardation in the rotation of the Earth, resulting in the gradual lengthening of the day and there is also irregulartities in the period of rotation for other reasons. As a result, the *Universal Time* (U.T.) which is the mean solar time of Greenwich determined by the meridian observation, does not increase uniformly. So, a new measure of time, termed as *Ephemeris Time* (E.T.) has been introduced from the year 1960. The relation between the two time scales is E.T. = U.T. + Δ T. From 1984 the term E. T. was replaced by the term Dynamical Time.

Universal Time (U.T.) is the Greenwich Mean Time beginning at midnight. Terrestrial Dynamical Time (T. D. T.) is the uniform time system which is used in computing the ephemeris of the bodies of the solar system. T.D.T is currently ahead of U.T. by a small amount of Δ T which is determined by observations. So T.D.T=U.T+ΔT.

Values of Δ T from 1983 to 2014 and extrapolated values from 2015 to 2021

Year	Δ T	Year	Δ T	Year	Δ T	Year	Δ T	Year	Δ T
	s		*s*		*s*		*s*		*s*
1984.0	53.79	1992.0	58.31	2000.0	63.83	2008.0	65.46	Extrapolated	
1985.0	54.34	1993.0	59.12	2001.0	64.09	2009.0	65.78	2016.0	+68
1986.0	54.87	1994.0	59.98	2002.0	64.30	2010.0	66.07	2017.0	+68
1987.0	55.32	1995.0	60.78	2003.0	64.47	2011.0	66.32	2018.0	+68
1988.0	+55.82	1996.0	+61.63	2004.0	+64.57	2012.0	+66.60	2019.0	+69
1989.0	56.30	1997.0	62.29	2005.0	64.70	2013.0	+67	2020.0	+69
1990.0	56.86	1998.0	62.97	2006.0	64.85	2014.0	+67	2021.0	+70
1991.0	57.57	1999.0	63.47	2007.0	65.15	2015.0	+68	2022.0	+70

Estimated value of ΔT in 2020 is +70*s* (i.e. 1 minute 10 seconds). Therefore 0*h* G.M.T. or U.T. occurs 70 seconds after 0*h* E.T. or T.D.T. The relation will be 0*h* E.T.= 5*h* 29.0*m* a.m. I.S.T. and 0*h* G.M.T or U.T. = 5*h* 30*m* a.m. I.S.T. The correction to obtain the planetary positions from 5*h* 29*m* to 5*h* 30*m* I.S.T. will be as follows based on the estimated value of ΔT = +70*s*. The correction are close approximation but may be in error by a few seconds in this process.

When the value of ΔT is 70*s* and the daily motion of planet is 1°, the correction will be nearly +2.79" and for 5° motion the correction is + 13.95" ; for 10° motion, the correction is +27.9" and for 15° motion the correction is +41.85". etc. The correction for any intermediate value of motion may be found out by simple interpolation. When the value of ΔT changes, the corrections will also change according to the value of ΔT. From 1981 onwards ΔT is for Jan. 1, 0*h* U.T.

STANDARD TIME ZONE AND SUMMER TIME

Standard Time of the world is reckoned from Greenwich, recognized as Prime Meridian of Longitude. The world is divided into 24 standard zones, each of 15° of arc or 1 hour in time apart. The zones to the east of Greenwich are numbered from 1 to 12 with *'minus'* sign indicating that the number of hours is to be subtracted to obtain Greenwich Time. Similarly the zones west of Greenwich are prefixed *'plus'* indicating that the number of hours are to be added to get Greenwich Time. However the Standard Time maintained by many countries does not coincide with this Time Zone.

Standard Time Zone in India

The Central Meridian of India is situated at 82° 30' East longitude and 23° 11' North latitude (latitude of Ujjain). The Indian Standard Time is related to the Local Mean Time of 82° 30' E. Meridian *i.e.*, 5*h* 30*m* ahead of Greenwich. So the Time zone is 5*h* 30*m* in India.

In India, to obtain the *local time of the place* from I.S.T. *add* 4 × [difference of longitude of the place from 82°30' E] when the station is west of 82° 30' E. and *deduct* when the station is east of 82° 30' E. longitude. In other words, Standard Time = Local Time – 4 × (E. Long. –82° 30') minutes of time or Local Time = + 4 × (82° 30' – E. Long.) mins. of time.

In other countries, when the place is east of Greenwich, the L.M.T. of the moment is more than G. M. T. by the time equivalent of the longitude and when the place is in west, it is less than G.M.T.

For example, the longitude of Kolkata is 88° 22'.6 E (Alipore Obsy). The time equivalent of longitude measured from Greenwich (long. 0° 0') at the rate of 4 minutes per degree is 88°22'.6 × 4 = +5*h* 53*m* 30*s* which is the difference of local time at Kolkata from G.M.T. As I.S.T is 5*h* 30*m* ahead of G.M.T., so the correction to get I.S.T. will be –23*m* 30*s*.

Daylight Saving Time or Summer Time

Day light Saving Time is achieved by advancing the clock by one hour. Adjusting clock time for the use of the added day light on summer evenings is adopted by many countries of the world.

Standard Time Zone in the U.S. and Other Countries

The United States are divided into eight Standard Time Zones as per Uniform Time Act of 1966, which also provides use of Daylight Saving Time. The eight Time Zones are designated as Atlantic, Eastern, Central, Mountain, Pacific, Yukon, Alaska-Hawaii and Bering (Samoa). The time in these zones is reckoned from 60th, 75th, 90th, 105th, 120th, 135th, 150th and 165th meridians west of Greenwich. The time in these zones is earlier than Greenwich Mean Time by 4, 5, 6, 7, 8, 9, 10, and 11 hours respectively *i.e.* the Standard time of the zones is obtained by subtracting the hours from G.M.T. or U.T as mentioned of the respective zones.

The Soviet Union lies over 11 Time Zones from 2*h* to 12*h*, but maintains its standard time 1 hour fast of the designated zone. It also proclaims daylight saving time as does Europe.

China lies over 5 time zones, but the entire country is placed on zone time *minus* 8 hours with daylight saving from April 12 to September 12. In the Southern Hemisphere many countries observe daylight saving time from October to March. Most countries situated near the equator, however, do not use *'Summer Time'*.

Daylight Saving Time in the U.S.

Under the Uniform Time Act of 1967, all States, the district of Columbia and U.S. territories were to observe Day light Saving Time beginning at 2 a.m. on the last Sunday in April and ending at 2 a.m. on the last Sunday in October. As per amendment for exemption, the State of Arizona, Hawaii, Puerto Rico, the Virgin Islands, American Samao and part of Indiana are now exempt.

As per legislation signed on July 8, 1986, the Day Light Saving time started from first Sunday in April instead of last Sunday in April will still end on the last Sunday in October.

Kirtikant Sharma Collection, Najafgarh

CC-0. In Public Domain. Digitization by eGangotri

On the first Sunday in April, clocks are set ahead 1 hour at 2.00 a.m. local standard time which becomes 3.00 a.m. local daylight time. On the last Sunday in October, clocks are set back, one hour at 2.00 a.m. local daylight time, which becomes 1.00 a.m. local standard time.

At present all places in the U.S. observe daylight time except Arizona, Hawaii, and most of Indiana. Many other states observe some form of "Summer Time" but do not necessarily change their clocks on the same date as the U.S.

Daylight Saving Time in the U.S.

From 2015 to 2020 the Daylight Saving Time are as follows :

From Second Sunday in March to First Sunday in November.

2015	Daylight	Saving	Time	begins	on	March 8	and	end	on	November 1
2016	"	"	"	"	"	March 13	"	"	"	November 6
2017	"	"	"	"	"	March 12	"	"	"	November 5
2018	"	"	"	"	"	March 11	"	"	"	November 4
2019	"	"	"	"	"	March 10	"	"	"	November 3
2020	"	"	"	"	"	March 8	"	"	"	November 1

(*Source* : Nautical Almanac Office, U.S. Naval Observatory, Washington)

British Summer Time

The United Kingdom kept British Summer Time (BST = GMT + 1*h*) during the following periods.

As per the proposal of European Union, the dates of Summer Time from 2015 to 2020 are as follows :

From last Sunday in March to last Sunday in October

2015 March 29 to October 25
2016 March 27 to October 30
2017 March 26 to October 29
2018 March 25 to October 28
2019 March 31 to October 24
2020 March 29 to October 25

Changes occur at 1 a.m. G.M.T.

(*Source* : H. M. Nautical Almanac Office, Royal Greenwich Observatory, Cambridge).

The Period of Summer Time of different Countries

Daylight Saving Time of one hour (*i.e.* when the clocks are advanced by one hour) is followed every year **from last Sunday in March to last Sunday in October** in the following countries (dates are however provisional).

Austria, Belgium, Czechoslovakia, Denmark, Finland, Germany, Greece, Hungary, Iraq, Italy, Luxembourg, Norway, Poland, Portugal, Spain, Sweden, Switzerland.

In other countries the period of Summer Time is as follows :—

Australia	—	First Sunday in October to First Sunday in April.
Canada	—	Second Sunday in March to First Sunday in Novmber.
New Zealand	—	Last Sunday in September to First Sunday in April
Russia	—	Last Sunday in March to Last Sunday in October.
United Kingdom	—	Last Sunday in March to Last Sunday in October.
United States	—	Second Sunday in March to First Sunday in November.

International Date Line

The International Date Line is a zig-zag line which approximately coincides with the 180th Meridian. The calendar dates are separated from this line. The date is advanced by one day when crossing in westerly direction and set back by one day when crossing in an easterly direction. The line is deflected eastward through the Bering Strait and westward of the Aleutians to prevent separating these area by date. The line is again deflected eastward of the Tonga and New Zealand Islands in the South Pacific.

Rule :— Add proportional log. of planet's daily motion to log. of time from 5-30 a.m., I.S.T. and the sum will be the log. of the movement required. If the time be after 5-30 a.m., add this movement to the given position of planet, but if before subtract, and the result will be the planet's true place at the given moment (if retrograde, subtract for add). For accurate position of Moon, interpolation correction is to be taken. (See *Interpolation Table* Page No. 47)

Example :— Required longitude of Moon on 13th April, 2020 at 20*h* 23*m* I.S.T. at the time of Transit of Sun into *Meshu Rasi*. Longitude of Moon on 13th April at 5-30 a.m I.S.T. =8° 05° 49'. Daily motion on that date is 13° 14'. Log. of 13° 14' = 0.2585. Time of the event from 5*h* 30*m* a.m. = 14*h* 53*m*. log. of which is 0.2075. Sum of these two is (0.2585 + 0.2075) = 0.4660 which is log. of 8°12'. The required longitude of Moon is, therefore, 8°05°49' + 8°12' = 8°14°01' *i.e. Dhanus* 14°01'. For greater accuracy, *interpolation correction* may be taken.

Astronomical Observatories in India

Observatories of Sawai Jai Singh

The first observatory called **Jantar Mantar**, was built by Maharaja Sawai Jai Singh II (1686-1743 A. D.) who was the ruler of princely State of Jaipur from 1699 to 1743 A.D. The word derived from the Sanskrit word *Yantra Mantra* means instruments and formula. His first observatory was built in 1724 at Shajahanabad three kilometers from the city of Delhi (now in Connaught Place, Delhi). He also built four other observatories at Jaipur (1734). Varanasi (1737), Ujjain, and Mathura. The last one is no longer extant. Among these four observatories, the Delhi and Jaipur observatories are effectively existent. Sawai Jai Singh II built observatories to encourage astronomical studies in the country and to popularise astronomy among the people of India. It was his firm faith in astrology that lead him to study with a view to obtaining reliable and correct data about the position of heavenly bodies. His inspiration mainly came from the observatory established by Prince Ulugh Beigh, who established in 1433 A.D. an enormous observatory at Samarkhand (now in Uzbekistan).

The Samrat Yantra, built by Sawai Jai Singh II in 1728 A.D. at Jaipur is the biggest Sundial in the world. It gives local solar time to an estimated accuracy of 15 seconds.

Kodaikanal Observatory

The Kodaikanal Solar Observatory is situated at Palani Hills in Tamil Nadu, which lies over about 7000 ft above sea level and started functioning in 1900. This observatory at Kodaikanal initially had a wide array of spectroscoping equipments specially acquired for solar studies. It has, at present, a large solar telescope combined with a powerful spectrograph, a coronagraph and a monochromatic heliograph. It is one of the three major solar observatories in the world. It is now under the administrative control of the Indian Institute of Astrophysics (IIA) of the Govt. of India.

Nizamiah and Japal-Rangapur Observatories

Nizamiah Observatory was normally set up at Begumpet in 1901 as a private observatory. It was taken over by the then Hyderabad Government of Nizam in 1908, and attached to Osmania University in 1919. Plans for the modernisation of the observatory were initiated by the University Grants Commission in 1954. A 48-inch reflector telescope was installed in the year 1968 at the new site named Japal-Rangapur. In 1983 the historic Begumpet site was vacated and Nizamiah Observatory shifted to a new building in the Osmania University Campus. The observatory, at Japal-Rangapur is, at present, engaged in various astronomical research programmes involving binary stars, spectroscopic observations, stellar dynamics etc.

Uttar Pradesh State Observatory, Naini Tal

This was the first observatory to be set up in India after independence. It was started in 1954 at the old city of Varanasi by the U. P. Government. In November 1955, this observatory with M. K. Vainu Bappu as the Chief Astronomer, shifted to its present site at Manora Peak in Naini Tal. A 40-inch Zeiss reflector telescope was installed in this observatory in 1972. Research works on stars, star clusters and galaxies, Sun and solar activity are being carried out here.

Kirtikant Sharma Collection, Najafgarh

CC-0. In Public Domain. Digitization by eGangotri

Vainu Bappu Observatory, Kavalur

Kavalur Observatory is located amidst sandal wood forests in Jawadi Hills in the North Arcot District of Tamil Nadu and was set up in 1968 as a part of the Kodaikanal Observatory. On April 1, 1971, the Kodaikanal Observatory was made into the Indian Institute of Astrophysics of the Government of India with headquarters at Bangalore. A 40-inch Carl Zeiss telescope was installed at Kavalur in 1972. On January 6, 1986 the 93-inch telescope was installed here and this is, at present, the largest telescope of Asia. This telescope was completely fabricated and built in India indigenously. This telescope and the Kavalur Observatory was named after its founder, M. K. Vainu Bappu in the year 1986. Various types of research work on Astrophysics are being pursued here.

Udaipur Solar Observatory

The Udaipur Solar Observatory was set up in 1975 on a small island in the Fatehsagar lake in Udaipur, under the aegis of the Vedhshala Trust, Ahmedabad. In December 1981, the observatory was taken by the Government of India's Department of Space, and attached to the Physical Research Laboratory, Ahmedabad. This observatory began its scientific work with an old 10 ft. spar telescope, which has been completely modified. This observatory is, at present completely engaged in helioseismological study.

Gurusikhar Infrared Observatory

The Gurusikhar Observatory is situated on Mount Abu, in South Rajasthan. It is a part of the Physical Research Laboratory (PRL) of Ahmedabad. A telescope of 1.2 m aperture mainly intended for studies in the infrared was installed at Gurusikhar and become operational in 1985. The astronomy group at PRL has developed expertise in focal plane instruments for special studies in infrared astronomy.

Ooty Radio Telescope

The Ooty Radio Telescope is the first major radio astronomical facility available in India. It is situated on Nilgiri Hills in Udhagamandalam (Ooty), Tamil Nadu. It became operational in 1970. One of the principal objectives of this telescope has been the determination of the brightness distribution of a large number of weak and distant extragalactic radio sources.

Giant Metre-wave Radio Telescope (GMRT)

The Giant Meter-wave Radio Telescope is situated near Khodad, about 80 Km north of Pune. It is one of the most powerful radio telescopes of the world. Both the GMRT and the Ooty Radio Telescope, are now under the administrative control of the National Centre for Radio Astrophysics (NCRA) Pune, which is again under the Tata Institute of Fundamental Research (TIFR), Mumbai.

Planetariums in India

The country's first Planetarium was established in India by the Birla Education Trust in co-operation with the Government of West Bengal at Kolkata. The Birla Planetarium was inaugurated on September 28, 1962. This planetarium is the second largest planetarium of the world. The Planetarium has been renamed as M. P. Birla Planetarium. At present 32 Planetariums have been established in India. Names of the Planetariums in India, with their years of opening and number of seats, shown in brackets, where available, are given below according to the years of their installation.

Sl. No.	Name and address	Year of opening & number of Seats
1	2	3
01.	**Birla Planetarium** (Renamed as M. P. Birla Planetarium) 96 Chowringhee Road Kolkata-700 071,West Bengal	1962 (678 seats)
02.	**Sardar V. Patel Planetarium** Baroda Municipal Corporation Sayaji Bang, Bayayi Garden Vadodara-390 018, Gujarat	1976 (125 seats)
03.	**Nehru Planetarium** Dr. Annie Besant Road, Worli Mumbai-400 018, Maharashtra	1977 (583 seats)
04.	**Jawahara Planetarium** Jawaharlal Nehru Memorial Fund Anand Bhawan, Uttar Pradesh Allahabad-211 002	1980 (80 seats)
05.	**Prataprudra Planetarium** Behind Municipal Office Warangal-506 007, Andhra Pradesh	1983 (80 seats)
06.	**Nehru Planetarium** Jawaharlal Nehru Memorial Fund Teen Murti House New Delhi-110 011	1984 (270 seats)
07.	**B.M. Birla Planetarium** Arch. & Cultural Research Institute, Adarsh Nagar Hyderabad-500 463, Andhra Preadesh	1985 (150 seats)
08.	**Nehru Planetarium** Municipal Corporation, Ludhiana Ludhiana	1985
09.	**Sri Sathya Sai Space Theater** Institute for Higher Learning Prasanthi Nilayam Puitiparthi-515 134, Andhra Pradesh	1986 (225 seats)
10.	**B. M. Birla Planetarium** Tamilnadu Science & Technology Centres Chennai-600 025, Tamil Nadu	1987 (250 seats)
11.	**B. M. Birla Planetarium** Birla Institute of Sc. Research Statue Circle, Jaipur-302005 Rajasthan	1987 (140 seats)
12.	**Planetarium** Institute of Human Resources, Manipal	1987
13.	**Modern High School For Girls** 78 Syed Amir Ali Avenue Kolkata-700 019, West Bengal	1988 (40 seats)
14.	**Planetarium** Goto Optical (India) Pvt. Ltd., 3, CD Shivam Chambers 53, Syed Amir Ali Avenue, Kolkata-17	1988 (40 seats)
15.	**Guwahati Planetarium** Government of Assam Science, Tech. & Environ. Dept. Dispur-781 006, Assam	1989 (50 seats)
16.	**Jawaharlal Nehru Planetarium** Bangalore City Corp. Sri T. Chowdaiah Road, High Grounds Bangalore-560 001, Karnataka	1989
17.	**Planetarium** Maritime Training Institute Mumbai-Powai	1989 (80 seats)
18.	**Pathani Samanta Planetarium** Planetarium Square Nandankanan Road Bhubaneswar-751 013, Orissa	1990 (140 seats)
19.	**Indira Gandhi Planetarium** Council of Science/Tech. West Boring Canal Road Patna-800 001, Bihar	1992 (270 seats)
20.	**Meghnad Saha Planetarium** University of Burdwan, Golapbag Burdwan-713 104, W. B.	1993
21.	**Planetarium** Raman Science Centre Opposite Gandhi Sagar Nagpur-440 018, Maharashtra	1994 (130 seats)
22.	**Planetarium** Kerala State Sc. & Tech. Museum Vikasbhavan Post Tiruvananthapuram-695 003, Kerala	1994 (250 seats)
23.	**Planetarium** Dhobarbhar Road Rajkot-360 001, Gujarat	1994 (75 seats)
24.	**Planetarium** Malabor Pioneer Hosiery Bldg., Calicut	1994
25.	**Planetarium** Science City, National Council of Science Museum, Kolkata, W.B.	1997 (325 seats)
26.	**Indira Gandhi Planetarium** 9, Mabiullah Road Suraj Kund Park, Lucknow, U.P.	2003 (168 seats)
27.	**N. P. L. Planetarium** National Physical Laboratory Hillside Road, New Delhi-110 012	
28.	**Planetarium** Council of Sc. & Tech. Lucknow, U.P.	
29.	**Planetarium** L. S. College, Muzaffarpur, Bihar	
30.	**Planetarium** Shri Arya Kanya Vidyalaya, Porbundar, Gujarat	
31.	**Planetarium** Govt. College of Engineering Salem, Tamil Nadu	(75 seats)
32.	**Planetarium** Gandhi Hill Foundation, Gandhi Hill, Vijayawada-520 001 Andhra Pradesh

Method for finding out Ascendant (Lagna) and Planets' positions of a Foreign city

Example : Date : 25th June, 2020
Time : $11h\ 00m$ (Local or Zonal Standard Time)
Place : Toronto
Latitude 43°39' North ; Longitude 79°23' West.

The place falls in the Pacific Zone (Eastern Time Zone) where time is $5h$ less than G.M.T. and $10h\ 30m$ less than I.S.T. Hence G.M.T. of the moment is $16h00m$ ($11h\ 00m + 5h\ 00m$) and I.S.T. is ($11h\ 00m + 10h\ 30m$)= $21h30m$.

Local or Zonal Standard Time	=	$11h\ 00m$
L.M.T. correction	=	$-17m\ 32s$
L.M.T. (for calculating Ascendant)	=	$10h\ 42m\ 28s$
I.S.T. = (Z.S.T. + $10h\ 30m$)	=	$21h\ 30m$

As the place is in the West of Greenwich, the L.M.T of the moment is less than G.M.T. by the time equivalent of the longitude of the place. *In finding the Sidereal Time and Ascendant of any moment, the Local mean time is to be used, while for finding the positions of the Moon and Planets I.S.T. is to be used.*

The procedure for obtaining Ascendant from the book *Tables of Ascendants* by N.C. Lahiri is shown below.

The L.M.T. of the moment is $10h\ 42m\ 28s$ which is $1h\ 17m\ 32s$ *before* Noon. The time interval of $1h\ 17m\ 32s$ from $12h$ Noon decreased by 10 seconds per hour (= 13^s) becomes $1h\ 17m\ 19s$.

Sidereal Time on 25th June, 2020 at $12h$ Noon ($6h\ 11m\ 46s + 3m\ 42s$)	=	$6h$	$15m$	$28s$
Correction to Indian Sidereal Time for Toronto	= +	$01m$	$46s$	
		$6h$	$17m$	$14s$
Decreases Time interval from Noon	= (–)	$1h$	$17m$	$19s$
Less, we get Sidereal Time for the moment		$4h$	$59m$	$55s$

Ascendant— The latitude being 43°39' North, the Table for 44°00' North is to be used.

Now from the book *Tables of Ascendants*, using Table for 44° 00' North according to Sidereal Time $4h\ 59m\ 55s$, the Ascendant comes out as 4^s 05° 29' Applying *Ayanamsa* correction of (–)1°09', we get the Assendant as 4^s24°20' *i.e. Simha* **24°20'**.

Tenth House : From the Table of Tenth House of the same book, according to same Sidereal Time $4h\ 59m\ 55s$, the Tenth House is obtained 1^s23° 11' by applying *Ayanamsa* correction of (–)1°09', we get the Tenth House as 1^s22°02' *i.e. Vrisa* **22°02'**.

Moon and Planets : The position of Moon and Planets is to be obtained for $21h\ 30m$ I.S.T. on 25th June, 2020 as per procedure shown in the example at the end of the Table of Logarithms. The longitude of Moon is, however, found to be 4^s 05° 16', *i.e. Simha* **05°16'**.

METHOD FOR CASTING OF BIRTH CHART

According to Indian System

For erecting a birth chart of any nativity three items are mainly required *viz.*, date of birth, place of birth and time of birth. The time is required either in local mean time of the place or the present I.S.T. The local time was in vogue all over India before 1st January, 1906. From 1st September, 1947 the use of L.M.T was completely abandoned and I.S.T was adopted for all places of India (*vide* Explanatory note on Time changes in India). ***L.M.T*** will have to be used in calculating the Ascendant (*lagna)* and ***I.S.T*** is to be used for determining the positions of planets.

In some cases the time of birth is supplied in *ghati* (*danda* or *nadika*) and *vighati* (*pala or vinadika).* In that case convert *ghati* and *vighati* in hours and minutes applying the relation that 24 minutes make one *ghati* and 24 secs. make one *vighati* and add the result to the sunrise,time or to the sunset time when the *ghati* and *vigahati* is given from sunset in case of birth in night. In this way the birth time is obtained in hours and minutes of the clock. But before that one should be sure that the available sunrise or sunset time is not in L.M.T. nor in Local apparent time, but in I.S.T. In the former case obtain the sunrise time for the date and locality in question in I.S.T. by calculation and then obtain the birth time which is then in I.S.T. Table for conversion of time into L.M.T. from I.S.T. and *vice-versa* has been given in the Ephemeris. Both L.M.T. and I.S.T. would be required in the preparation of horoscope. So keep both the times recorded in the working sheet. For the birth place obtain the latitude and longitude measured from Greenwich. If the exact value of these co-ordinate (*i.e.* lat. and long. of the place) are not known, then work with those of the nearest city available from some standard Atlas. The longitude will be utilised in finding the local time of place and the latitude in determining the *lagna* or Ascendant. From the longitude of the place the local time is determined (*vide* Table showing Lat, Long. and Local time of Places).

Many foreign countries keep Summer Time, *i,e,* they advance their clocks by one hour during summer seasons. In that case the recorded birth time should be reduced by one hour to obtain local standard time of birth. From that time obtain I.S.T. by correction given in Lahiri's *Tables of Ascendants* or *Indian Ephemeris.* From the same book calculate the Sidereal Time at birth and obtain the Ascendant or *Lagna* for the place. Example for finding the *Lagna* and *Dasama* (10th House) has been given elsewhere in this Ephemeris.

Then calculate the longitude of planets according to Indian Standard Time. The longitudes are given in signs (*Rasis*), degrees and minutes. 60 minutes make one degree and 30 degrees make one *rasi.* From I.S.T. as obtained or derived for the birth time, calculate the longitudes of planet (*grahasphu.a*). The longitudes are given for 5-30 a.m. I.S.T. in the yearly Ephemeris. If the birth time be exactly 5-30 a.m. or very near to it, then take the given longitudes as those for birth. The method of calculating the longitudes for any hour of I.S.T. has also been illustrated in the Example given in the Ephemeris. For this different tables have been given and the use of the log. tables has been illustrated. For calculation of ascendant and planetary positions of a Foreign City, the method has also been separately shown.

Now the planets and the *lagna* are to be placed in the birth chart. Thereafter *Navamsa* chart can be prepared from the Table of *Navamsa* as given in this ephemeris. The first figure in the longitude of a planet indicate the *Rasi* or sign. For example, if it is zero, place the planet in *Mesha or* Aries, if 1 place it in *Vrisha* or Taurus, 2 in *Mithuna* or Gemini, 3 in *Karkata* or Cancer and so on. The Ascendant or *Lagna* will have to be placed in the birth chart in a similar way. This completes casting of the nativity. The nakshatra division in which the Moon or the planet falls can be ascertained from the table given for the purpose. The *tithi* at birth time can be determined from the difference of longitude of the Moon and Sun. For *Yoga* add the longitude of Sun to that of Moon and consult the table of Yoga from which the number of *Yoga* current at birth time would be obtained. Then the *balance of dasa* is to be calculated. For this take the longitude of Moon and enter the table on the Balance of Vimsottari dasa at the time of birth or Astottari Dasa as is required. Then go on adding the period of dasa of subsequent planets as required. The longitude utilised for all the above purposes are the *nirayana* longitude as given in the Ephemeris. If ayanamsa is added to the *nirayana* longitude, then the Sayana longitude of the planet will be obtained which are, however, not required in casting of a nativity in the Indian system.

GLOSSARY

Definitions of some astronomical, astrological and calendarial terms :

Ephemeris— A tabulation of the positions of a celestial object in an orderly sequence for a number of dates—usually for one whole year.

Zodiac— An imaginary belt stretching about 9° north and 9° south of the ecliptic within which the planets and the Moon remain in course of their movement. In case of the Moon, the deviation from the ecliptic is about ±5°. The belt is divided into 12 equal sectors each of 30° and each sector called a 'sign' or *Rasi*. According to the western system of reckoning (i.e. *Sayana* system) the first *rasi i.e.* Aries starts from the point of intersection of the ecliptic and the equator. There are 12 signs or *rasis* in both the systems, the first being *Mesha* according to Indian system.

Tropical (or Sayana) Longitude— Tropical longitude of any celestial body is defined as the arc of the ecliptic intercepted between the first point of Aries and a perpendicular arc to the ecliptic drawn through the body. It is measured along the ecliptic from the vernal equinoctial point *viz.* point of intersection of the ecliptic and equator of date. Such longitudes are called tropical or *Sayana* longitude. As the equinoctial point is slowly moving backwards at the rate of nearly 50".3 per year due to precession of the equinoxes, the tropical or *Sayana* longitudes of all celestial bodies are gradually increasing on this account. In Indian astronomy, the initial point from which the longitude is measured is a fixed point on the ecliptic, so that the longitude of fixed stars might not undergo any change due to precession of the equinoxes. The angular distance between the above fixed initial point and the vernal equinoctial point is known as *Ayanamsa*. This fixed zodiac system is known as *Nirayana* system of reckoning in Indian Astronomy.

The apparent geocentric *longitude* and *latitude* of planets and stars are referred to the true equinox and ecliptic of date and are corrected for planetary aberration.

Celestial Latitude—Angular distance across the celestial sphere measured north or south from the ecliptic along the great circle passing through the poles of the ecliptic and the object.

Ayanamsa —The vernal equinoctial point or the *First point of Aries* is taken as the starting point for measuring of celestial longitudes. The celestial longitude of a heavenly body measured from this initial point is known as the tropical or *Sayana* longitude. Due to precession of the equinoxes (*ayana chalana)* the V.E. point is receding back over the ecliptic at the rate of about 50".3 per year, as a result of which the longitudes of fixed stars are increasing every year at the same rate. In order to stabilize the zodiac, a point has been taken as the origin which is permanently fixed on the ecliptic and this point is different from the V.E. point. The distance between this fixed initial point and the V.E. point or in other words the tropical longitude of the initial point is called *Ayanamsa*. The zodiac starting from this fixed origin is known as sidereal zodiac or *nirayana* zodiac. The tropical longitude of any celestial object *minus* the amount of ayanamsa on that date gives the *nirayana* longitude. The *nirayana* and the *sayana* zodiac coincided on vernal equinox day of 285 A.D. when the ayanamsa was zero.

Mean Ayanamsa for any date = Mean values of ayanamsa + precession in longitude for that date.

True Ayanamsa = Mean ayanamsa + nutation in longitude.

Transit of Planets—The transit time of Sun, Moon and planets is the time of its entrance into the signs of the zodiac (*rasis)* either tropical or sidereal or into the sidereal nakshatra divisions or its quadrants.

Kirtikant Sharma Collection, Najafgarh

CC-0. In Public Domain. Digitization by eGangotri

Heliacal Rising and Setting—The planets Mercury to Saturn (as well as the Moon) remain invisible to the naked eye for some days at the time of conjunction with the Sun. The phenomenon of the planets' (or the Moon's) invisibility due to its proximity to the Sun is known as combust or heliacal setting of the planets. The opposite phenomenon is defined as heliacal rising.

Tithi— Tithi or 'Lunar day' is a very important conception in Hindu astronomy. A tithi is completed when the longitude of the Moon gains exactly 12° degrees or its multiple on that of the Sun and as such there are 30 tithis in a lunar month. A difference in longitude of 12° indicates the ending of the 1st tithi, 24° that of the second tithi and so on. Tithis are shown from Sukla 1 to Sukla 15 (*Purnima* or Full Moon) and again from Krishna 1 to Krishna 14 and then Krishna 30 (known as *Amavasya* or New Moon).

Nakshatra—A nakshatra is completed when the *nirayana* longitude of the Moon as measured from the fixed initial point attains a value of 13° 20' or a multiple thereof. When the longitude is 13° 20', the first nakshatra (*i.e. Asvini)* ends, when the same is 26° 40' the second nakshatra (*Bharani)* ends and so on. There are thus 27 nakshatras which completes the circle of 360°.

Yoga—Like nakshatras, there are 27 yogas. A yoga is obtained from the sum of the nirayana longitude of the Moon and the Sun and the sum is divided into 27 parts of 13° 20' each. The first yoga (*Viskumbha*) ends when the sum is 13° 20', second yoga (*Priti)* ends when it is 26° 40' and so on.

Vaidhriti and Vyatipata Yoga— The Vaidhriti yoga is obtained when the sum of the *tropical longitude* of the Sun and the Moon amounts to 360° and Vyatipata yoga when it amounts to 180°. These aspects are treated as special *Yoga.*

Karana—A Karana is completed when the nirayana longitude of the Moon gains every 6° on that of the Sun. In each *tithi* there are two Karanas covering the two halves of the *tithimana.*

Solar months—The Solar months are determined according to the transit time of Sun's entry into twelve signs (like *Mesha, Vrisha* etc.) each of angular distance of 30°. There are various rules for determining the beginning of the solar months which are followed in different States.

Ascendant (Lagna)—The Ascendant or the orient ecliptic point is the point of intersection of the ecliptic at the given time with the eastern horizon of the place. In astrology, it is the first house of the horoscope and is also some times called the horizon. This point of intersection is very important as it is considered as the commencing point of the horoscope. The Earth makes a complete rotation of 360° on its axis from west to east with reference to a fixed star in 23*h* 56*m* 4.091*s* in mean solar time, and due to this rotatory motion, the whole sky appears to come up from below the horizon gradually. It is the '*Rising Sign*' in the eastern horizon. The period of each *lagna* is not equal like the *Rasi* division and slightly varies from place to place. There are 12 *lagnas* and their namings are the same as those of *rasi, e.g. Mesha, Vrisha,* etc.

Tenth House or M.C.—The point of intersection of the ecliptic of the given time with the meridian of the place is the tenth house for that moment. It is also termed as the mid-heaven or the Medium Coeli (M.C.) and is also sometimes called simply the meridian. The longitude of this point is, as usual, measured along the ecliptic from the first point of Aries. The right ascension of the M.C. is the sidereal time of the moment which is often called R.A.M.C.

Kirtikant Sharma Collection, Najafgarh

CC-0. In Public Domain. Digitization by eGangotri

Lunation—The month or lunation used in astronomy is the mean synodic period, which is the number of days comprised within a large number of lunations divided by the number of lunations. It is the time period from completion of one New Moon to the next New Moon. The present duration of lunation is 29.530589 days or $29^d12^h44^m2.9^s$. The lunation No. 1 is counted from January 16, 1923.

Lunar months—The lunar month is the time-period from completion of new-moon (conjunction of Moon with the Sun) to the next new-moon. There are two kinds of lunar months used in India, the new-moon ending and the full-moon ending. The *new moon ending* lunar months covers the period from one new-moon to the next. This is known as *Amanta* or *Sukladi system*. The day next to *Amavasya* is the first day of the month. The *full-moon ending* lunar month known as *Purnimanta* covers the period from one full moon to the next and begins from the day after full moon. This is known as the *Krishnadi system*. In this two systems naming of the months in *Sukla paksha* is the same, but in *Krishna paksha* the next lunar month is denoted, *e.g. Chaitra Sukla* in Sukladi system is equivalent to *Chaitra Sudi* in *Krishnadi* system, but *Chaitra Krishna* in Sukladi system is equivalent to *Vaisakha Vadi* in *Krishnadi* system and so on.

Sidereal time— The Sidereal time is the measure of time defined by the diurnal motion of the vernal equinox. Sidereal time system is derived from the Earth's rotation with respect to the stars. Local Sidereal time is defined as the local hour angle of the Vernal Equinox. It is 0^h at the instant when the vernal equinox is at the upper transit of the local meridian. Sidereal time is determined from observation of meridian transits of stars. Sidereal time at any instant is defined to be the west hour angle of the First Point of Aries (Vernal equinoctial point) from the upper meridian of the place. At mean noon *i.e.* 12 hour local mean time on any day sidereal time is the Right Ascension of the fictitious mean Sun, which is defined to be the tropical mean longitude of the Sun at the moment, as affected by mean aberration. Sidereal time system is derived from the Earth's rotation with respect to the stars. The duration of sidereal day in mean solar time is $23^h\ 56^m\ 4.091^s$. Sidereal time for a particular place and particular time increases per day at the rate of $24^h + 3^m\ 56.55536^s$.

Ephemeris time— Due to tidal friction on the Earth's surface there has been regular retardation in the rotation of the Earth, resulting in the gradual lengthening of the day and there is also irregularities in the period of rotation for other reasons. As a result, the *Universal Time* which is the mean solar time of Greenwich determined from meridian observations, does not increase uniformly. So a new measure of time, termed as *Ephemeris Time*, has been introduced from the year 1960. The relation between the two time scales is E.T. = U. T. + D T. From 1984 the term E.T. was replaced by the term *Dynamical Time*.

Universal time—U.T. is the Greenwich Mean Time beginning at midnight.

Terrestrial Dynamical Time— (T.D.T.) is the uniform time system which is used in computing the ephemeris of the bodies of the solar system. T.D.T. is currently ahead of U.T. by a small amount of DT.

Hour Angle—The angular distance on the celestial sphere measured westward, along the celestial equator from the meridian to the hour circle that passes through a celestial object.

Apparent Noon—Apparent Noon is the local mean time of Sun's meridian passage, *viz.*, the mid day.

Kirtikant Sharma Collection, Najafgarh

CC-0. In Public Domain. Digitization by eGangotri

Equation of time—The equation of time in the sense of correction applied to the local Mean Time to obtain local apparent time, may be deduced as follows : Equation of time = 12*h* – Apparent Noon.

Geocentric position— Geocentric position of any heavenly bodies is the apparent position as seen from the centre of the Earth.

Topocentric position—Topocentric position of any heavenly bodies is the position as seen by an observer at any specified point on the Earth's surface.

Heliocentric position—Observations with reference to the centre of the Sun is termed as heliocentric.

Polar Longitudes and Latitudes— The coordinates which were used by the *Surya Siddhanta* to denote star positions. These coordinates are now no longer used. In the diagram at p. 4 the lines ♈B and BS denote Polar Longitude or *Dhruvaka* (= *l*) and Polar latitude or *Vikshepa* (= *d*) respectively.

Right Ascension—Right Ascension of any celestial object in the angular distance on the celestial sphere measured eastward along the celestial equator from the vernal equinox to the hour circle passing through the celestial object.

Declination—It is the angular distance on the celestial sphere north or south of the celestial equator. It is measured along the hour circle passing through the celestial object.

Hour Circle—A great circle on the celestial sphere that passes through the celestial poles and is perpendicular to the celestial equator.

Mean Solar time—A measure of time based on the diurnal motion of the fictitious mean Sun assuming that the Earth's rate of rotation is constant.

Node—The two points on the celestial sphere at which the plane of an orbit of any rotating celestial object intersects a reference plane. In respect of the Moon, these two points are known as *Rahu* (Ascending Node) and *Ketu* (Descending Node).

Occultation—Obscuration of one celestial body by another of greater apparent diameter, especially the passage of the Moon in front of a star or a planet.

Eclipse—Obscuration of a celestial body caused by its passage through the shadow cast by another body.

In a *solar eclipse,* the Earth passes through the shadow cast by the Moon *i.e.* the Moon comes between the Earth and the Sun. It is *total* when the observer is in the Moon's *Umbra, partial* when observer in the Moon's *penumbra* and *annular* when the solar disc is not completely covered but seen as a ring at maximum eclipse. An *annular eclipse* occurs when the apparent disc of the Moon is smaller than that of the Sun.

In a *lunar eclipse,* the Moon passes through the shadow cast by the Earth, *i.e.* the Earth comes between the Sun and the Moon. It is *total* when the Moon passes completely through the shadow cast by the Earth. It is *partial* when the Moon passes partially through the Earth's *umbra* at maximum eclipse. The eclipse is *penumbral* when the Moon passes only through the Earth's *penumbra.* Maximum number of eclipse that may occur in a year may be 7, while the minimum number is 2.

Saros cycle—The laws of periodicity of eclipses at an interval of 18 years and 10 or 11 days.

Kirtikant Sharma Collection, Najafgarh

CC-0. In Public Domain. Digitization by eGangotri

Apparent place of any celestial object—The position at which the celestial object would actually be seen from the centre of the Earth, displaced by planetary aberration and referred to the true equinox and equator.

Meridian passage—Meridian is defined to be a great circle passing through the zenith and the celestial poles. It corresponds to geographical longitude of a place. A star or a planet passes over the meridian when the sidereal time of the moment becomes equal to the Right Ascension of the star or planet.

Conjunction—When the apparent celestial longitude or Right Ascension of two bodies are the same, the phenomenon is called conjunction.

Opposition—When the apparent celestial longitude of two bodies differs by 180°, the phenomenon is called opposition.

Inferior planets—The planets whose orbits lie within the Earth's orbit round the Sun, are termed as inferior planets. The planets Mercury and Venus are regarded as inferior planets..

Superior planets—The planets whose orbits lie outside that of the Earth are termed as superior planets. The planets Mars, Jupiter, Saturn etc. are superior planets.

Square—When the apparent celestial longitude of two bodies differs by 90° or 270°, the phenomenon is called square.

Direct motion —For orbital motion in the solar system, motion that is counter-clockwise in the orbit as seen from the north pole of the ecliptic. For an object observed on the celsetial sphere, motion that is from west to east, resulting from the relative motion of the object and the Earth (*i.e.* forward motion of any celestial object).

Retrograde motion—Motion that is clockwise in the orbit as seen from the north pole of the ecliptic. For an object observed on the celestial sphere, motion from east to west resulting from the relative motion of the object and the earth.

Although the planets always move in the same direction round the Sun, the apparent motion as seen from the Earth is not always in the same forward direction. They sometimes appear to move also in the backward direction. This is known as *retrograde motion* of a planet.

Greatest Elongation—The instants when the geocentric angular distances of Mercury and Venus are at a maximum from the Sun.

Equinox—The two points on the celestial sphere at which the ecliptic intersects the celestial equator. When the apparent longitude of the Sun is 0°, it is Vernal equinox and when 180°, it is Autumnal equinox. Day and night are equal on these points.

Solstice—The times of solstices are those at which the Sun's apparent longitude is 90° (summer solstice) and 270° (winter solstice). At summer solstice the day is longest and at winter solstice the day is shortest for observers in the northern hemisphere.

Ecliptic—The mean plane of the Earth's orbit around the Sun or simply the apparent path of the Sun in the sky during the course of a year is known as ecliptic. It is a great circle cutting the celestial equator at an angle of about $23\frac{1}{2}$ °. The angle varies from 22° 55' to 24° 13'. This is known as the *obliquity of the ecliptic.*

Celestial equator—It is a great circle of the celestial sphere drawn halfway between the poles and is the great circle in which the plane of the earth's equator cuts the celestial sphere.

Kirtikant Sharma Collection, Najafgarh

CC-0. In Public Domain. Digitization by eGangotri

Inferior and Superior Conjunction—The geocentric inferior conjunction of Mercury and Venus occurs when the planet is between the Earth and the Sun and superior conjunction occurs when the Sun is between the planet and the Earth.

Nutation—Nutation is essentially that part of the precessional motion of the pole of the Earth's equator which depends on the periodic motion of the Sun and the Moon in their orbit around the Earth.

Osculating elements—The osculating elements are the elements of the instantaneous ecliptic orbit of the planets around the Sun determined by its actual position and velocity components for the instant, and so the elements are affected by the attractions of other planets.

Stationary, Direct and Retrograde point of a planet—The position at which the rate of change of the apparent longitude or right ascension is momentarily zero.

Meridian Circle—A great circle passing through the celestial poles and through the zenith of any place on Earth.

Obliquity—The angle between the equatorial and the orbital planes of a body. In Earth the obliquity of the ecliptic is the angle between the planes of the equator and the ecliptic.

Magnitude of a lunar eclipse—The fraction of the lunar diameter obscured by the shadow of the Earth at the greatest phase.

Magnitude of a solar eclipse—The fraction of the solar diameter obscured by the Moon at the greatest phase of a solar eclipse.

Aberration—The apparent angular displacement of observed position of celestial object from its geometric position, caused by the velocity of light in combination with the motions of the observer and of the observed object.

Aphelion—The point on a planetary orbit when it is at the greatest distance from the Sun. The Sun's radius vector is the longest at this point (heliocentric).

Perihelion—The point on a planetary orbit when it is at the least distance from the Sun. The Sun's radius vector is the shortest at this point (heliocentric).

Perigee—The point at which a body in orbit around the Earth is at the least distance from the earth. Perigee is also used with reference to the apparent orbit of the Sun around the Earth.

Apogee—The point at which a body in orbit around the Earth is at the greatest distance from the Earth. Apogee is also used with reference to the apparent orbit of the Sun around the Earth.

Aspect—The apparent position of any of the planets or the Moon relative to the Sun as observed from the Earth and angular relationship between two celestial objects. Details of the degrees of the aspects are discussed in chapter on Aspects and Phenomena.

First Quarter & Last Quarter—When the apparent celestial longitude of Moon differs by 90° and 270° over the Sun's apparent longitude, the phenomena is called first quarter and last quarter respectively.

Constellation—A group of stars, bearing the names of mythical Greek heroes and of objects occurring in Greek legends to identify an area of the celestial sphere.

Twilight—The time interval preceding sunrise is morning twilight and following

Kirtikant Sharma Collection, Najafgarh

CC-0. In Public Domain. Digitization by eGangotri

sunset evening Twilight during which the sky is partially illuminated.

Tropical Year— The tropical year or the year of seasons, is the time of the passage of the Sun from one vernal equinox to the next vernal equinox. The vernal equinoctial point slips to the west at the rate of about 50" per year. Therefore, the Sun has to travel 360° 0' 0" (–)50" = 359° 59' 10" to arrive at the new vernal equinoctial point, hence the duration of the tropical year is ***less*** than that of the sidereal year by about 20 minutes 25 seconds as at present.

Julian Day Number—The Julian Day number is the number assigned to a day in a continuous count of days beginning with the Julian day number 0 assigned to the day starting at Greenwich mean noon on Jan. 1, 4713 B.C.

Julian date—Julian date of any instant is the Julian day number plus the fraction of the day since the preceding noon and it is interval of time in days since 4713 B.C. January 1, Greenwhich Noon. The Julian day begins at noon, whereas the calendar day begins at the preceding midnight and count days from midnight to midnight.

Sidereal Period—Sidereal Period of planets is the time taken to make one complete circuit of the Sun. In case of Moon it is the time taken to make one complete circuit of the earth.

Synodic Period for Moon—Interval between one New Moon and the next; *for planets* the mean interval of time between successive conjunctions of a pair of planets, as observed from the Sun.

Sidereal Year—The sidereal year is the mean period of revolution of the Earth in its orbit with respect to the background stars (from fixed star to fixed star). Due to precession of the equinoxes, the tropical year is less than the sidereal year by the time taken by the Sun to traverse 50" *i.e.* by 0.014172 days or about $20^m\ 25^s$ as at present.

The length of the sidereal year is 365.256363 in mean solar days. The solar day is larger than the sidereal day, because by the time the earth completes a rotation about its axis, the Sun slips nearly a degree to the east, due to motion of the earth in its orbit and it takes a little more time for the Sun to come to the meridian of the place.

Sidereal Day—The Sidereal day is defined in astronomy as the period between two successive meridian passages of the First point of Aries. As this point has a slow westward motion among the fixed stars, the duration of the so called sidereal day is very slightly less than the actual sidereal day or the period of rotation of the Earth.

Eclipse Year—The eclipse year or the draconitic year is the mean interval between successive passages of the Sun through node, *i.e.* the time taken by the Sun to return to the same node, is known as draconitic year or the year of dragons.

Anomalistic Year—The anomalistic year is the mean interval between successive passages of the Earth through perihelion (perigee to perigee).

Savana Year—The months of the calendar consists of 30 days each and the year is of 360 days.

Uttarayana—The period covering the north-ward journey of the Sun is know as *Uttarayana, i.e.* northward passage and it consist of Winter, Spring and Summer seasons. It is the period from winter solstice to summer solstice. The period starts from Sun's entry into Capricornus (Sayana *Makara)* on December 21-22.

Dakshinayana—It is the period from summer solstice to winter solstice *i.e.* southward passage of the Sun and it consist of Rains, Autumn and *Hemanta* seasons.

Kirtikant Sharma Collection, Najafgarh

CC-0. In Public Domain. Digitization by eGangotri

The period starts from Sun's entry into Cancer (Sayana *Karkata*) on June 20-21.

Shri Chaitanyabda—The year 1 begins from Phalguni Purnima of 1407 Saka or 1486 A. D. (Birthday tithi of Shri Chaitanya)

National Calendar of India—The year of National Calendar begins from March 22 in an ordinary year and March 21 in a leap year. First month of the Calender is *Chaitra* (Solar month). The calendar was introduced by the Govt. of India which effect from 22nd March, 1957 corresponding to Chaitra 1, 1879 Saka. With Saka Era as the main Era.

Vikram Samvat (Luni-solar)—Vikram Samvat begins from the tithi of Chaitra Sukla 1 (Sukla Pratipad) according to the *Chaitradi system*, and from Kartika Sukla 1 on *Kartikadi system* (in Gujarat) and from Vaisakhi (solar) in Panjab. The Vikram Samvat started from 57 B.C.

Saka Era (Solar & Luni-solar)—Saka Era begins from (1) March 22 or March 21 of the National Calendar (Solar), (2) From Chaitra Sukla Pratipad (Luni-solar) and (3) Vaisakhadi (Solar). Saka era started from 78 A.D.

Bengali San (Solar)—The year begins from Vaisakhadi (*i.e.* day following transit of the Sun to Mesha rasi). Bengali San 963 started in 1556 A.D.

Fusli San (Luni-solar)—Fusli Era begins from Bhadra Krishna Pratipada tithi of 592 A.D.

Amli San (Luni-solar)—Amli San begins from Bhadra Sukla 12 of 592 A.D.

Kollam Era (Solar)—The year begins from the day of transit of Sun into Simha Rasi and the first month is Simha (Chimgam). The year started from 824 A.D.

Kaliyuga Era (Solar)—The Kaliyuga Era is measured by the number of years elapsed since 3102 B.C. (–3101 A.D.) Feb. 17-18 midnight (Ujjain), when the mean Sun according to Surya Siddhanta became zero.

Buddha Nirvana Era (Luni-Solar)—The year begins from Vaisakhi Purnima (S15) of 545 B.C. (–544 A.D.).

Mahavira Nirvana Era (Luni-Solar)—The year begins from Kartika Sukla 1 of 528 B.C. (–527 A.D.).

Nimbarkabda—The year begins from Lunar Kartika S15 of 3096 B.C.

Vedanga Jyotish year—The year begins from Lunar Magha S1.

Parsi Calendar & Era—The Calendar year begins from the month of Farvardin the year are reckoned from 630 A.D.

Japanese year—The year begins from January 1 of 660 B.C.

Hejira (Lunar)—The year started from 622 A.D. The first month of the year is Muharram of the Islamic calendar. It consists of 12 lunar months, the beginning of each month being determined by the first visibility of the lunar crescent after new-moon. No intercalation is made for determination of month. The year makes a circuit of the seasons in every 33 years.

Barhaspatya Varsha (or the Jovian year) of South India—The year commences from *Prabhava* which are 60 in number and is used as the era in the Tamilian calendar, the year of which begins on April 13-14. It is also used in the Telugu calendar and the Mysorian calendar which are luni-solar and the year begins with lunar *Chaitra* after the new-moon day falling between March 14 and April 13-14.

Barhaspatya Varsha of North India—In North India there are also 60 Jovian years

Kirtikant Sharma Collection, Najafgarh

CC-0. In Public Domain. Digitization by eGangotri

with the same name as in the South starting from *Prabhava* as No. 1. The years are determined by the entry of Jupiter (*Brihaspati)* by mean motion into different *Rasis* beginning from *Kumbha* rasi.

Bhaskarabda of Assam (Solar)—Same as Bengali San (Solar).

Sankarabda of Assam (Luni-Solar)—The year 1 begins from Asvina Sukla Dasami tithi of 1448 A.D. (or 1449 A.D.—in some opinion) birthday tithi of Shri Sankara Deva of Assam.

Byzantine Era — The Byzantine Era used at Constantinople and elsewhere, with a variety of beginning dates of the year, was reckoned from 5509 B. C., the supposed year of Creation.

The Jewish Calendar and Era—The ancient Jewish Calendar which was empirical was replaced probably during fourth century of the Christian Era, by the fixed calendar which is still in use. It is regulated by the 19-year cycle as intorduced by the Babylonians about 380 B.C. The calendar year begins from the month of Tishri. The years are reckoned according to the supposed year of Creation for which the adopted epoch is 3761 B.C., Oct. 7.

Seleucid Era — Adopted in western Asia under the Seleucid monarchy was one of the most widely used era. The era was reckoned from 312 B.C. October 1.

Nabanassar Era (Babylon)—The Era of Nabanassar was extensively used by Ptolemy and early astonomers for dating observations and constructing astronomical tables. It is reckoned from the accession of Nabanassar to the throne of Babylon in 749 B.C. but there is no certain evidence that it was actually used as an historical Era.

The Julian Calendar—The Julian Calendar was established in the Roman Empire by Julius Caesar in 46 B.C. by revising the previous local calendars of Rome, with the advice of the astronomer Sosigenes. It remained in general use in the West until 1582, when it was further modified into the Gregorian Calendar which has come into worldwide use for civil purposes. In the Julian Calendar a common year is defined to comprise 365 days and every 4th year is a leap year comprising 366 days.

The Gregorian Calendar— The Julian year of 365.25 days was longer than the true year of 365.2422 by .0078 days and so discrepancy was noticed in the observance of Easter Day. In 1582 the error in the calendar reckoning accumulated to 10 days. In 1582 Pope Gregory XIII revised the calendar and ordained that Friday, October 5 of that year was to be counted as Friday, October 15. For the future, centurial years that were not divisible by 400 were not to count as leap-years.

As such the century years 1600, 2000, 2400 which are divisible by 400 are leap years whereas the century years 1700, 1800, 1900, 2100 although divisible by 4, are not leap years.

As a result the number of leap-years in 400 years was reduced from 100 to 97 and the year-length of the calendar thus became 365.2425 days, the error being only one day in 3300 years. In Great Britain, it was officially introduced in 1752 when the error accumulated to 11 days and in that year 3rd September of Julian Calendar, Thursday was designated as the 14th September of Gregorian Calendar, Thursday. At the same time in Great Britain the beginning of the year was changed from March 25 to January 1, commencing with the year 1752. In some countries the Gregorian calendar was not adopted until the present century.

Glossary

Chinese Year and Calendar —The ancient Chinese lunar calendar is divided into 12 months consisting of 29 or 30 days according to duration of lunar month. The calendar is synchronized with the solar year by the addition of extra months at fixed intervals like the Indian luni-solar calendars. Each year is related to the 12 animal designation and the animal designation of the year 2000 is Dragon.

The calendar is based on a sexagenary *i.e.* 60 years cycle. Both the New Year of Gregorian calendar (Jan.1) and their traditional lunar calendars are used and as such two New Year's celebration are held. The Chinese New year begins at the first New Moon after the Sun enters Tropical Aquarius *(Sidereal Makara-Kumbha)*. The day may fall between Jan. 21 and Feb. 19. The date is fixed according to the New Moon of the Far East. In some year the date occurs one day before or after lunar *Magha Sukladi*, as per Indian lunar calendar.

2009	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	2020	2021
Ox	Tiger	Hare	Dragon	Snake	Horse	Sheep	Monkey	Rooster	Dog	Pig	Rat	Ox

This cycle of 12 years is repeated upto 60 years. So there are 5 cycles of 12 years each totalling 60 years. The animal name of the year of birth of the person can be known from the above chart. The year *Ox* recur in 2021.

The beginning of the Chinese year with corresponding Chinese names from 2009 to 2021 are shown below :

Year	Animal designation of the Year	Corresponding Chinese name	Sun enters Trop. Aquarius (I.S.T.)	Newmoon following Transit of Trop. Sun	Era beginning
2009	Ox	Ji-Chou	Jan. 19, $28^h\ 10^m$	Jan. 26	4646, Jan. 26
2010	Tiger	Geng-Yin	Jan. 20, $9^h\ 58^m$	Feb. 14	4647, Feb. 14
2011	Hare	Ji-Mao	Jan. 20, $15^h\ 49^m$	Feb. 3	4648, Feb. 3
2012	Dragon	Geng-chen	Jan. 20, $21^h\ 40^m$	Jan. 23	4649, Jan. 23
2013	Snake	Xin-si	Jan. 19, $27^h\ 22^m$	Feb. 10	4650, Feb. 10
2014	Horse	Ren-wu	Jan. 20, $9^h\ 21^m$	Jan. 30	4651, Jan. 30
2015	Sheep	Gui-wei	Jan. 20, $15^h\ 13^m$	Jan. 20	4652, Jan. 20
2016	Monkey	Jai-shen	Jan. 20, $20^h\ 57^m$	Feb. 8	4653, Feb. 8
2017	Rooster	Yi-you	Jan. 19, $26^h\ 54^m$	Jan. 27	4654, Jan. 27
2018	Dog	Bing-xu	Jan. 20, $8^h\ 39^m$	Feb. 15	4655, Feb. 15
2019	Pig	Ding-hai	Jan. 20, $14^h\ 30^m$	Feb. 4	4656, Feb. 4
2020	Rat	Wu-Zi	Jan. 20, $20^h\ 25^m$	Jan. 24	4657, Jan. 24
2021	Ox	Ji-Chou	Jan. 19, $26^h\ 10^m$	Feb. 11	4658, Feb. 11

PRINCIPAL FESTIVALS AND ANNIVERSARIES 2020 A.D. *contd.*

Moslem Festivals

Hazrat Ali's Birthday	Mar.	9 Mon.	Chehlum	Oct.	8 Thurs.
Shab-i-Miraj*	Mar.	23 Mon.	Akhiri Chahar Samba	Oct.	14 Wed.
Shab-i-Barat*	Apr.	9 Thurs.	Shahadat-e-Imam Hasan	Oct.	16 Fri.
First day of Ramadan	Apr.	25 Sat.	Milad-un-Nabi or Id-e-Milad (Birthday of Prophet Mohammed)	Oct.	30 Fri.
Shahadat-e-Hazrat Ali	May	15 Fri.	Fateha-Duwaz-Dahum or Barah Wafat	Oct.	30 Fri.
Shab-i-Qadr*	May	21 Thurs.	Id-e-Maulad	Nov.	4 Wed.
Jamatu'l Vida	May	22 Fri.	Fatiha-Yaz-Dahum (Giarhween Sharif)	Nov.	27 Fri.
Idu'l Fitr	May	25 Mon.			
Iduz Zuha (Bakrid)	Aug.	1 Sat.			
Muharram	Aug.	30 Sun.			

* Observed in the preceding night. The above mentioned date of Festivals begin at sunset on the previous evening and end at sunset on the dates as tabulated. Dates are subject to actual sighting of lunar crescent after New Moon.

Christian Festivals

Epiphany (Fixed)	Jan.	6 Sun.	Ascension Day	May	21 Thurs.
Ash Wednesday	Feb.	26 Wed.	Whit Sunday-Pentecost	May	31 Sun.
Palm Sunday	Apr.	5 Sun.	Trinity Sunday	Jun.	7 Sun.
Good Friday	Apr.	10 Fri.	First Sunday in Advent	Nov.	29 Sun.
Easter Sunday	Apr.	12 Sun.	Christmas Day	Dec.	25 Fri.

Jewish Festivals

First Day of Passover (Pesach)	Apr.	9 Thurs.	Day of Atonement (Yom Kippur)	Sep.	28 Mon.
Feast of Weeks (Shavuot)	May	29 Fri.	First Day of Tabernacles (Succoth)	Oct.	3 Sat.
Tishabeab	Jul.	30 Thurs.	Last Day of Succoth (Simhath Torah)	Oct.	11 Sun.
Jewish New Year Day (5781) (Rosh Hashanah-1 Tishri)	Sep.	19 Sat.	Hanukah	Dec.	12 Sat.

Parsi Festivals (Shahenshahi)

Jamsedji Naoroj (Fixed)	Mar.	21 Sat.	Parsi New Years' Day (1390) (1 Farvardin)	Ayg.	16 Sun.
Zarthost-no-Diso	May	23 Sat.	Khordad Sal (Birthday of Prophet Zarthost)	Aug.	21 Fri.
Gatha Gahambar	Aug.	13 Thurs.			

National Days of India and neighbouring countries

Indian Republic Day	Jan.	26 Sun.	Pakistan National Day	Mar.	23 Mon.
Sri Lanka National Day	Feb.	4 Tues.	Bangladesh National Day	Mar.	26 Thurs.
Nepal National Democracy Day	Feb.	18 Tues.	Indian Independence Day	Aug.	15 Sat.

Special International Days

International Woman's Day	Mar.	8 Sun.	U. N. Charter Day (1945)	Jun.	26 Fri.
World Health Day	Apr.	7 Tues.	World Population Day	Jul.	11 Sat.
World Book Day	Apr.	23 Thurs.	World Literacy Day	Sep.	8 Tues.
World Environment Day	Jun.	5 Fri.	United Nations Day	Oct.	24 Sat.
International Day against Drug Abuse and Illicit Trafficking	Jun.	23 Tues.	International Day for Disabled Persons	Dec.	3 Thurs.
			Human Rights Day	Dec.	10 Thurs.
Hirosima Day (1945)	Aug.	6 Thurs.	Nagasika Day (1945)	Aug.	9 Sun.

Dates of Holidays of Govt. of India offices at Delhi and New Delhi are shown in bold letters.

Laser Setting at New Pagesetters : Printed at Five Star Printing House, 11A, Garpar Road, Kolkata-9.

LIST OF PUBLICATIONS

(Works by N. C. Lahiri)

1. Lahiri's Indian Ephemeris–***Published annually***–Containing daily *Nirayana* longitudes of planets with their latitudes, declinations, meridian passages and *tithi, nakshatra, yoga*, transits of planets into different *rasis*, etc. An exhaustive aspectarian and phenomena and many other useful data have been given for astronomical and astrological calculation. Issues for 1939 to 2010 out of print. Prices for 2016 to 2018 Rs. 150.00 each, 2019 & 2020 Rs. 200.00.

2. Condensed Ephemeris on *Nirayana* basis – Containing daily longitude of the Moon and weekly longitudes of other planets with bi-weekly longitude of Mercury and monthly longitudes of Rahu, Uranus, Neptune and Pluto. Sidereal time, Tables of Dasa, latitudes and declinations of planets, etc. have also been given. Part III onward upto Part VIII B contains the longitudes of planets at 2-day intervals and Part IX-A and IX-B contains daily longitudes of planets.

Part I	— Covering	Twenty-six years,	1875 to 1900 A.D.	Out of Print
Part II	— Covering	Forty-two years,	1900 to 1941 A.D.	Rs. 80.00
Part III	— Covering	Eleven years,	1941 to 1951 A.D.	Rs. 150.00
Part IV	— Covering	Eleven years,	1951 to 1961 A.D.	Rs. 150.00
Part V	— Covering	Eleven years,	1961 to 1971 A.D.	Rs. 120.00
Part VI	— Covering	Eleven years,	1971 to 1981 A.D.	Rs. 150.00
Part VII-A	— Covering	Five years,	1981 to 1985 A.D.	Rs. 150.00
Part VII-B	— Covering	Five years,	1986 to 1990 A.D.	Rs. 150.00
Part VIII-A	— Covering	Five years,	1991 to 1995 A.D.	Rs. 150.00
Part VIII-B	— Covering	Five years,	1996 to 2000 A.D.	Rs. 150.00
Part IX-A	— Covering	Five years,	2001 to 2005 A.D.	Rs. 200.00
Part IX-B	— Covering	Five years,	2006 to 2010 A.D.	Rs. 200.00
Part X-A	— Covering	Five years,	2011 to 2015 A.D.	Rs. 200.00

3. Advance Ephemeris — for 100 years (from 1951 to 2050 A.D.) Containing *Nirayana* monthly longitudes of the Sun, the outer planets and Rahu with bi-monthly longitudes of Mars. The longitudes of the Moon, Mercury and Venus for any day can be obtained by little calculation. Longitude of the Sun is correct to a minute and other to one or two decimals of a degree. Tables for latitudes, declinations, eclipses, etc. have also been given. 3rd edition. (In Press for reprint).

4. Tables of Ascendants — Containing tables for finding the *Nirayana* Lagna for all latitudes from 0° to 60° North or South and the Tenth house for all places. Rules have been given for finding the other houses according to all the important systems. Rs. 200.00

5. Tables of the Sun — For finding the longitude of the Sun (both *Sayana* and *Nirayana)* and all other solar elements correct to a decimal of a second for the period from 3200 B.C. to 2400 A.D. 3rd edition. (In Press for reprint).

6. Tables of Sunrise, Sunset & Moonrise, Moonset—For all latitudes with variation for each day and for each degree. (In Press for reprint).

7. Panchanga Darpan *(in Bengali with an Appendix in English)* — For calculation of *tithi, nakshatra* and *yoga* etc. without utilising the longitudes of the Sun and the Moon. The appendix portion gives tables for finding the new-moon and full-moon times during the period from 1500 B.C. to 2500 A.D. 4th edition. Out of Print.

Available from all leading book-shops of India and abroad
